actually
goes
okay cool thanks everyone for taking the time as we already
discussed and I think before we kick it off I think a few of us don't know each other yet so
I think I would like to start with a brief round of introduction so
maybe I I just started because I'm already talking so I'm Dominic
yeah
part of the blocked saying
industry for I don't know a few years have been very active in cardano over for for a few years
discovered singularitynet last summer and have like a few funnel purposes in both ecosystems and started to build trust level yes last year it's a I call it project but it might become a company or startup that's about building reputation protocols so yeah oh my
funded projects in both ecosystems are more or less around reputation so that's my
let's say my somehow might my passion or one of my passions so yeah that's about me
maybe I hand over to Pete
I think thanks better offering from Netherlands working for Singularity not Foundation
closing and on three years now
started off at was a Community member but at some point they figured I was working anyway so they offer the job mostly on marketing side of things and shifting my personal preference I have to add the most likely to community work
one of the projects there is the ambassador program
and
yet relevance there to to reputation is recognition of Community member contributions
short version
thanks
to having you on board again Nicholas how would you
yeah of course yeah my name is Nicolas
recently I became the governance leader the Cardinal Foundation but whatever that means yeah that's
it's just a title but what I'm really doing is really trying to push education when it comes to governance within the cardano foundation and in the community right because we're going through this whole process maybe some of you know right of becoming a decentralized truly
Democratic yeah that can be discussed Community right so and I'm with the foundation now for one year and 10 months before I was a community manager and also really working a lot with Meetup organizers in the ambassador program of the Cardinal Foundation
so yeah really currently really focused on governance
and still events like the Cardinal Summit yeah this is what I'm
what I'm doing currently at the foundation
and also in in my spare time unfortunately yeah this applies to everybody here spare time like there's not
yeah cool could have you on board as well Rafa
sure sure Raphael Perez here I am currently based in Sao Paulo Brazil
and I am the operations manager for the Deep funding program from single art match with his grant program

pretty much the centralized from our perspective and from what we we see now and one of my main
goals under my role it's exactly to make this decentralization work along right
it's something that's very new and it's challenging so
I hope to also have your support and and to forests all to go forward with this decentralization through governance operations and and so on before this role I worked for about four years and the Iota Foundation German blockchain foundation in the capacity of business developer
so now I am about 10 months about one year working in deep funding very happy happy for the people that I was able to meet here very nice people in this ecosystem everybody pretty much willing to make this
process of decentralization and those and Etc you work properly and yeah that's what I am also aiming for the other areas not only for the web Trill landscape right I truly believe
this new concept of decentralization it can be applied in many many Industries and therefore actually the word and let's not forget this level of artificial intelligence with big part of it
decentralizing it
yep thank you
amazing thanks Richard you Organics
yes of course thank you so yeah my name is Victor greetings for everyone I'm talking about Ambassador since two years it's a voluntary 100% voluntary thing so I'm not work for talk about I'm not work for charity Technologies or website Foundation it's just for my pleasure and in the meantime I organized nearly 20-ish bottle of Meetup in my hometown Budapest hungry and organizing currency of blockchain be and here today that I speak about coconut technology I'm very much involved in Portland technology from several aspects I actively involved in the open governance work
it's very nice but very complex to understand if this means the if this meeting is for to educate you about how political governance is works I can do that very much it's my favorite topic this is my Felix invited me to this this call and currently I'm involting so projects which is deeply
in the framework in the frame of pocket of network and all the substrate-based blockchains and I'm open to every possibilities this is why I'm here so in very short this is me thank you
okay we are very curious to hear all the stuff later
yeah China
good morning everyone I'm Joanna I've met a lot of you but for those who haven't met before I'm Palestinian Joe Daniel I've been in the space for a while but what really captured me about the space is decentralized covenants and one thing led to the other I got really involved with a lot of cool projects to initiatives one of which is we've been supporting deep funding as part of future for helping them build their reputation tool for how they calculate their voting weight so for a proof of concept we were able to build an automated calculation for a score that represents their contribution on a portal on a proposal portal and now for the MVP we're integrating the voting data into that learning ways and through this hopefully we'll learn what the next steps for such a tool would be so I'm really happy to be here thank you
thanks for getting up early
and I assume Thomas the last one
can't hear you made
we can see that you unmute and mute let's continue

okay maybe we start with the
like what we are going to do today and and then we give Tom the the mic again
you wanna share and sites please
okay so what we want to do today is yeah yes we already said to yeah exchange ideas Concepts and experience in regards to to governance and reputation
so this and to give you a little bit of context this Workshop is part of a series that as part of a successful proposal of deep funding around three so Felix and I facilitated a few workshops
um
we I we lost you Dominic or at least I cannot hear you
same to me
give it a second
it's right it's perfect Friday night yeah
I hope you have something to drink I myself got a coffee it's awesome to have a coffee and a car and the cigarette and that's fucking awesome
victim
yeah was it just me yes I think you froze for a second okay yeah my soon closed and opened again so I don't know what happened there
and back to action sharing the slides again and don't worry guys we don't have a lot of slides with bunch of stuff the biggest part of the thing is really Workshop so we went to discussion State yeah
where did you lose me
okay when you said it was that initiative is a funded proposal from the last Defender actually okay so talks shoutout to depending for the sexually thanks it's clear so yeah we called it
future of
reputation in the centralized Innovation funds even though it goes a bit beyond that and yeah the first Workshop we were really focused on the future of defunding itself the second one is as I said in the beginning we were talking with together with different initiatives inside of the
singularity net ecosystem and yeah today we wanted to bring together if
like people from outside singularitynets and yeah to
yeah oh see what's left and right and getting to know different approaches and and different different initiatives and different brains and Minds
so
yeah that's that's why we're here and we have basically three guiding questions for today around which we want to when I have a good discussion with you guys and so you want to start by
allowing every one or every representative of each ecosystem to talk a bit about like how governance works for cardano polka dots as singularitynet and also how you deal with the topic of reputation like that's the reputation play a role how do you make decisions so yeah that's that's how we want to start to just get to know each other better
and the second part will be a reflection I would say so we want to hear some stories what worked well maybe also some stories where governance failed for example
and then the third part and I'm very excited about that part we want to bring some a little bit together like how can we support each other how can we maybe

and this this workshop and yeah have an idea where we gonna meet next and what we want to talk about next aware we can support each other so that's
the third part of of the basic Workshop so we have plans 90 minutes it's already we've already spent almost half an hour or for introduction and
um getting to know each other so yeah I would say without for that you let's let's kick it off Felix you want to
want to add something
hmm nope nothing chat and we understand that governance is nothing what you easily describe in three four minutes right so it's already quite a challenge for you guys already through to take out the first question so ideally we try to stay a little bit on High level and figure it already archive where do we see some patterns where these do we see large differences or commonalities and Industry
and respect also in this regard very from your own individual experience as well right so you don't have to reflect a whole ecosystem or whatever what not really as a
as a person as well to its topics
and on this one then let's go step by step maybe then so the first question is really is the status quo so how is it right now in Rica to governs
how does it actually works
what does governance mean to you in this regards maybe first one Nico I assumed on the screen
yeah absolutely
right okay what is the current state of governance in cardano right now
we don't have currently decentralized governance currently we have
free entities that hold seven so called governance Genesis Keys however you want to call it
and they there's a majority of a quorum of five needed out of those seven keys to
initiated change right this is one entity of the current governance system and then on the other hand you have to stake pool operators the validators
who of course have I would even say the real power in the system because they are the ones running the the system right there the ones who produce blocks who keep the protocol running so they have the the real power but the problem is
for them to really be let's let's say make decisions they need to coordinate they need to come together
and it's the same in every ecosystem so this is how it currently works we have this one Genesis key holders which are the cardano foundation with two a Margo with two and iog with free so this is the structure and the stake pool operators
and decision currently I think how it happens if we talk from a process level these three entities have communication channels really traditionally business channels and that's how they coordinate changes and changes don't happen often
right hard for example when when do they need to coordinate for hard Fork chain for hard Fork initiations
for parameter changes which also don't have more often currently and for example for the Catalyst treasury withdrawals that's where they currently coordinate so this is the current governance system on cardano and yeah I think a lot of you already understand what's the problem here

the free entities really can
make decisions that could impact the entire cardano ecosystem
and yeah this is why we change it now
awesome thanks not to Disney car ready I think this interesting because I mentioned already really interesting pattern writer governance actually identify through three main topics
cut Fox protocol updates for funds movements and the sexyware governs let's say comes into action actually on the function
then Pete
okay next on the screen over human
yeah I guess I'll make a distinction between
Singularity not Foundation governance deepening governance which Rafael can talk more about and
maybe also within the ambassador program
so
on a foundation level we don't have a our own blockchain so there's no parameters on the network kind of stuff there's topics like artwork
and hopefully we won't have that anytime soon but we had one
basically I would say the trigger for this is also coming from yeah it's a bit centralized it's the foundation
noticing there's a need for something and then calling out a vote
it's been very basic so far just one Pokemon vote very straightforward
yeah and some other topics would be like allocation of specific funds or the establishing of a supervisory Council for example so at this type of hurts but yeah it's very basic I would say and it's not even properly on gen so there's a world of improvement there
then yeah within the ambassador program we try to be
as decentralized as possible I would almost say there's
yeah decision making usually this is relatively straightforward and I just flows into a Direction
so most of the time we've succeeded with either consensus or consent checks
we have had some voting but only very experimental and
yep that's
what maybe to complete Rafa you could do the different one
yeah exactly yeah that's the flow right exactly well deep funding is about the experimentation right
sometimes especially in the governance side is decentralization and Etc we sense that we are kind of a Sandbox for the single art-net foundation in in the perspective of initiatives
we have tried many things
consent consensus and and so on for the governance part initially between rounds Grant rounds we used to have this governance rounds
so community members Gather in zone calls Choice well yeah twice a month and we use it to discuss the points what went right what went correctly in the previous round and then members would put some topics that they would like to see
from there we had a vote on the topics getting that information we would put in the next round of the grants
and from that we discovered that

sometimes it was still very centralized because of lack of capacity around the Deep funding itself because for instance at the beginning before I join it was only young right the head of the Egypt funny

and things sometimes it's they are difficult to communicate and get feedback and so on

so from this process we started with the following what this enlightened Foundation was doing in this sense of creating these Council or board for governance and then we went with our own because of some bureaucracies and Etc we decided to grow with our own Council which was the focus group

the focus group itself it's not about taking the decisions but it's about communicating better with the community and hearing better

from the community to the community right so we have weekly calls for instance and matter most channels where we discuss topics and then from there we can create and and be and create more structure it topics where we can go to the community or the focus group can go to the community and hear from them what it should be done or not

for instance because we tried we tried pulse in our governance calls before so online polls yeah let's do a poll here and see what you guys are thinking but then it wasn't perfected generated a lot of confusion as well

getting back to the focus group now they have this listening sessions where they are able to listen the community around that specific topic and one again experimentation for instance we had this decision to to be made

what we did we discussed internally with the focus group and say hey this is what we are willing to do anyone here from the community you are going to have two weeks to say I disagree because of this this and this and then we would

take this again and say to the community okay is it is this make sense but always in in a very experimental way professional but experimental in this sense of trying new things and check if it would be particularly when it involves finances right in this case we were about to pay some contributors in the community and so on so we wanted to have this more specific

understanding of what the community think and from the beginning about the rounds who votes to elect or select the projects that are going to be funded the community right it's not about us what we do is should deliver the structure the website and the system that you can comment and and assess the proposals and Etc but in the end who is going to decide is the community one challenge that we have now is to have a big community and engage at community that can bring a better decision into all of these because this is still a small for instance for voting in the grants and and so on we don't feel that we have the size and diversity and of true to select the best

projects and proposals so it's all connected and we are going to go into this reputation thing because it's also very important in this sense of decentralized governance

that's where we we are willing to do we don't want to take the decisions by by ourselves we want to have the community deciding

then yeah that's it

yes it's not traffic

then and I take a bunch of notes also in the background so this is of good stuff already shared here and Victor the next current state on political governance where are you at or whatever right now guys

yeah can you hear me
yes
super so firstly I'd like to ask should I use we sharing later or I should I just tie you in five minutes how this thing you are comfortable about or what should I do if you go to whatever you think is the best of it
yeah so this is the time where I jumped or
circumstances you do whatever you want to do yes into this thing like quaker.com and stir through the pharmacy
this is a central element you
how many minutes each person have
so I'm
but you can you can start giving an overview for a couple of minutes and then we can do a second round where we may go into best practices and stuff so so we can keep it interactive a little bit but yeah feel free to just no I think ideas in five minutes and go to the other people and then we have time either internally fine yeah okay so on
first of all that is not just one blockchain it's
nearly 1150 block ten years on South Street watching the framework so if I say talk about I mean the roller coaster system because two popular relay chain there there is a lot and a lot of parking or parties are the they are not just remember and these are chains blockchains can be connected to the spot so imagine one main chain and they are interconnected the possible so and all the managers or transactions
yeah not managing to talk about to finalizing all the transactions but happening on the side changes the Productions and
this is different let's do our system introverable because of religion knows every state of the party and because it knows just the governance and it confused
if your sound is breaking a little bit up from I said I have a little bit hard time to understand you are
okay because
should I eat like this
it makes a better effect yeah
sorry
it's it's
to my phone
giving a second
so already really nice also to compare I love examples we are not even our own blockchain and in polka dot yeah we have a bunch of different plot chains here nicely in the middle yeah
yeah you got out here is right and
not a blockchain multiple block chains in the middle of blockchain yeah I think it's that just by listening to you guys this is something so interesting already in this regard to say okay aqueous system can apply to many different contexts in this regard right and why they all have the same challenges okay how to make let's say ideally in this regard on same decision making protocol so what not in this regard
happen relates to a bunch of different space like coming mentioned before us well think right where at the earliest can be applied to many different Industries right you mentioned it

so say yes the decently decision right so if ecosystem one chain or shadow of chains all face the same issue
okay I'm back is it better
mmm not really but not whatever yeah maybe maybe it's your airports I don't know I I believe
yeah maybe
yeah
the story is my family closed from my home unfortunately and I'm currently so yeah it's right
okay yeah should I do anything else
right
here I believe it's possible to understand just go on just go on yes it's okay okay
so
but I just wanted to say
yeah
coming and it's used to upgrade the ball blockchain that's right
for treasury management and change some parameters in for this into the blockchain and in addition to make
cross-chain message channels which is kind of like a bridge but it's interesting page between all and parties
so basically
every decision about the ball ecosystem manageable through the alignments Amazon and each party has its own unit so
Imaging like if similar like so the book of
ecosystem is similar like the European Union there independent states and unite and because they are trusted on the European Union the citizens and
and between the conference because all of this all of the nose and all of
countries are interconnected Under the Umbrella of European union and it's a little bit similar to talk about because the purchase are Trust on talk about and every transaction including the governments
related transactions can flow across the ball
blockchain Network
yeah
there is no single Authority
but are but it's controlling talk about so of course there is a company called parity Technologies we are the developers of the main source of
and there's an organ not profit organization behind it which is actually foundation and
but they are not really they are not controlling popular because parties step back in the come in the last month and in the future
maybe we lost or kind of disappeared
and the people who are want to write code of thought about can join to a collective which is called the fellowship and this Fellowship
basically registry to London blockchain and they have the right to
upload new source code to relation and everybody and join to this Fellowship to this Collective really 670 people are correctly but in the future that will become
it is not all and

in the meantime the governor on the reference does not just the fellowship campus everybody who holds the dots.com and both on Russian and so it's basically and make accuracy and
and
the combo of America doctors and liquid democracy because everybody can join the popularity and
if the person have some
with knowledge about how to hold of and in the in time it's a liquid democracy because people who have dogs can delegate these dots to other persons like me
or I if I'm if I have lots of course I have not I can balogate to any other people who have so the openings are announcing so every transactions it's on chain so will it transparent everybody can see everything and not shielded Decay or any other stuff yeah so in very sure this is how this works of course there's a lot of games Theory and other stuff yes so it's very agile yes
but to understand well we need to jump much more but if we have time you can jump back later I would like to just start the five minutes comprehensive story about it yeah
some things that vector and Southwest got enough to get together anyway so things don't matter
then and Tom watch wanna come I am back of sound I hope so yeah there you are man good also can you
right
hey so Tom I'm also a popular Ambassador I'm kind of in this call mostly because I have a kind of more academic interest in reputation systems so from like the game theory mathematical side of things and I'll just severik is kind of more the real expert on technically helpful governance works I'll just add a couple of things which I think important for understanding kind of where where it can go from here so the one thing is that mentioned is that the runtime upgrades so the actual upgrades of the blockchain or the blockchains because they're power chains and they all go through governments and that's so there's there's a whole process there's not just the Unchained governments there's a deliberative process loads of like
of chain coordination work that people do to put it through
and also something that I think is important from the way the system works mathematically is that you have different authorities so there's token based voting but there's also the the collectives which includes the the fellowships which are kind of like a council so they have
they they have authority because they're chosen for skills and involvement and so forth so for example if there's a big problem if they're turned out to be like a massive bug then they could act more quickly than the then the the pure token base referenda
yeah I mean I think it's really interesting but it's a part of my interest in reputation systems is that
they can never be stable like mathematically they can never be stable they have to keep moving and so like when because polka dots governance is hugely complex the moment I mean it's quite difficult for outside as to understand quite difficult even for insiders to understand
and
there's a lot of there's a lot of off-change coordination and
and the more the more complex it gets the more complex

it needs to get if you know I mean which is obviously a turn off but I think this is necessary for any government system whether it's whether it's you know real world of business government or a blockchain so yeah that's that's it I think I think it's

I certainly the most advanced in terms of a game theory and complexity and I think that it and all governance systems are just going to get more complex as time goes on

so that's a great that's statement that's for sure thanks a lot Tom really good than citizens

especially when you said here to reputation system say they they can't stay the same right there on static like they have to change like yes definitely

maybe Tom you can answer Nicholas question in the chat so he asked who makes the final or maybe even Vic so we can

just continue to discussion here because I think it's a very interesting

yeah so the question is actually the balance

father regarding the who

finally the fellowship or the thought of others a decision I my answer is both

but mostly oh well there's but the complex thing is the fellowship can

can shortening the

shortening the referendas in time and because there are curves the

there are two types of cards for every

referendum does every couple of

and these carbs are basically calculated from a form for a formula and these formulas are represents each formula have a difference characteristics

and

yeah so it's this is this is the question what's possible governance and

can be complex so I can I can I am not show it if I share my screen

yeah

I really appreciate it and yeah it's

right there usually not the easy answers in the covenants discussions

but exactly even explained it very well and also a term in the chat

I think I have an understand better understanding yeah thanks

but I think

I think that's also mentioned but also

another coffee

an interesting analogy is you know what's happening in the the us at the moment because there's this 300 year old system of checks and balances and you know it's always been stable but then someone can come and tip it over and say well this is this is possible within the system so what you know what happens if if I do this what happens you've got these these repository like the electors or whatever you've got these or you know the separation of powers you've got these repositories of power which are held by officers but what happens if we mess with that what happens if we say okay well I'm going to send in my own officers to do it or whatever so it's kind of

and I think that's obviously pretty dangerous for the country but I think it's also necessary in any governance system to have the ability to kind of tip it over like that that's this is kind of an answer to the question like could the dot holders replace the fellowship so yeah I mean there's always there's always that danger lurking around the corner and I think that's

that's just something that we have to get a hedge around
you know we can't design it out we could design it out but then you'd have other negative consequences
that's a great and and also understand this and also came back to recommend you mentioned to a deep life like it's a massive challenge to a generic or quickly over governments right I mean the conversation here's one we could have for weeks and months and like each government's is very complicated but you can also deep life on khadana consider Chicago committee and CIP processes and the spr and everything there ideally in today's core we try to protect ourselves a little bit from going too deep into reperto's it's really just catch a high level already a little bit how can make a difference is our commonalities in this figure
and we had left one out but for the first question and actually at shawarma very interesting perspective on this one for sure
like it's cool right now from your perspective on governance
I'll just touch on something I think that wasn't really mentioned because a lot of the stuff were like on chain mechanisms but it's also very important for governance like how do we come to decisions off chain and what methods can be used to make sure that you know this decisions I've made in the most decentralized manner a really cool concept that we've been doubling with this this concept of sociocracy that builds upon in self-based mechanism rather than consensus so not like majority wins but mostly and this is like because obviously in a governance there's tears to how decisions are made so in terms of cardano for example there's a constitutional committee it's more one person one vote but then there's dear apps that's more maybe one token one vote or quadratic voting or however with that goes but on that level when it's one person one vote or it's more people oriented how do we create a system where like it's more consent based and how does that process look like look like so this is something that I think is very important as like a main Foundation
but then also within defunding in the work we're doing there and how some improvements could be made because not right now it's quadratic voting but it's really just the square root of the token holding
but in Improvement could be something like preferential voting where you can have like it's quite radic voting but as well you add preferences to the different proposes that you want to vote for and so there's different mechanisms what I wouldn't go really deep into that but I think these are just other than everything that was mentioned because I think it's all it's a combination of everything these are the two points that I think are also very important to know
well I have a quick question Felix and Dominic should I also explain about the future governance system on cardano maybe I was actually about to ask you to touch on that before we go to the next question because you kind of share their status quo but yeah
stop with a cliffhanger so yeah sorry about that I left up just died but yeah I'm back and I'm done thank you
happy that your bank swim I was just I was just mentioning that maybe I should all explain where we are with the current governance discussion in cardano right because we are in a very centralized State and we don't want to be there anymore so currently we're undergoing through this whole process of really becoming a
um yeah something that maybe polkadot is or other ecosystems are where we come to a system that is more democratic with like one Ada one vote

right if that's a fair system or not that is I'm not touching that right now but that's that's the whole discussion and the plan is that
not these free entities that I mentioned before have to control but really the community right and we will not just have
these we call them delegated representatives in the end that's just the people who vote so anybody can register themselves as a voter as a d rep
and then vote on this governance decisions and governance decisions are protocol parameter changes treasury withdrawals hard Fork initiations but also something like info governance action that means like a poll you can just start a poll yeah and then we have other two important bodies
the Constitutional committee
which is basically a body that
checks if a referenda if a governance action if a proposal
that comes from the community right so anybody any Ada holder can initiate a proposal they can just propose something a change whatever
and they this constitutional committee they have to check if this proposal aligns with the cardano Constitution
the cardano Constitution doesn't exist yet
so in theory that's what they would do they only check hey is this proposal lining with the cardano Constitution
and if it does then they just approve it right if not they disapprove it and yeah it doesn't go through and then as I mentioned right we have the stake pool operators they have very
indirect control
I would say right but in this new governance system of cardano they will also be able to directly vote on specific proposals yeah so we really basically the switch is from
currently very centralized governance system to a more decentralized governance system with a liquid democracy kind of system
plutocratic if you really want to
say it right it's it's the truth I mean that's that's where we start and a strong emphasis is also on
this is a minimal viable governance system where it's not the B like it's not the end all be all it's really the the first step right where we start and then we want to continue and make it more inclusive Fair more yeah open and not just based on a pure one coin one vote system and when I say we I don't mean myself as cardano Foundation employee I mean myself is the cardano community
and I don't speak for the qurano community but as a cardano community member yeah
I think you have your hand up
yeah I just want the Right facts this one both are going same so this is kind of to talk about it because also use these mechanism and there was a debate we should
issues implements some way better one person had one vote of course that would be the best in some ways
are not the best but would be efficient but in the other and we cannot guarantee this
this one person on both because we haven't

guarantine each person has only one of the wallet or Cardinals or Cosmos or a term what there is no technology so we have some quadratic voting which is a nice Vision it's impossible it's that we have investment in general
on both of some Cardinal or in the world industry yes we have this hypocrisy one would ever token thing on Google so of course we have so Bells have much more say in the system than me because I have not many much oh but of course is someday it's similar like stock market and if I hold one near your Microsoft so I have a say Microsoft company just for example because I match deeply eboard I'm very much sleeping but in Microsoft in this case because I have a lot of financial things in system so similarly on the Imagine like the same if
lot of dogs
I have a bigger say but I have a big responsibility and we have to be this very much a lot of okay we have much more
yeah so in conclusion
quadratical thing it's it's really nice correctly come and do that so we have this good Progressive here yeah but in some days it's nice to have and it's it's logical because of this
organization
it's six of the perfect yeah sure
yeah quadratic voting is also something that we have in our grants selection the voting itself so you have a snapshot at the end of the voting period and then we calculate
the the weight of each vote so you have quadratic voting
and in the the voting for the projects are proposals that are going to be selected yes we do have
right it's still it's not perfect of course especially because I see as a snapshot so it's you can go there and put a lot of agix in our wallet for that specific moment so sometimes we even we even don't want to share the time of the snapshot to avoid such a situation where one can go it's going to be two PM UTC of the third so I'm going there and going to put a lot of Ajax
um but it's something that we have at this point because the issue of course with their one token one vote is we have whales right that can change the course of what we want
something that we already talked about it and it's
kind of difficult even technically speaking is true it's to have for instance the time spent that you have those tokens in your wallet so this is also some things so if the person has a long time
the tokens in their wallets they are more connected to the program itself so it should have a better rate so doing this balance it's something that I guess all of us are willing to do but then
I guess it was you I don't recall now it was mentioned at about yeah
for people from outside
it's difficult to understand even for people inside it's difficult to understand all the system for the governance
and now we are in another dimension we are not
about people that are only vaulted with our blockchain or ecosystem right so they can dive we are expecting to have people around the world and with many backgrounds and and so on so this is something that I truly believe it's going to be the most difficult
challenge which is education for those that are
from outside and inside as well

because it's it's not as we mentioned at its Innovation it's something new so it's not something that people have has in their blood right how to operate in the an environment with this complex governance systems

and how much if we make it too complex how much are we avoiding people to jump in we are creating friction for them to jump in so this is very very tricky I tend sometimes should go with The Simple Solution exactly because of this for instance

I something that I am also experimenting

is having some sort of tiered approach on decision so if it's a critical decision we might have the most complex situation to receive vote from the community right for instance should we give one million or five million to the next round of Grants this is something that it's rely very much on the lap of the community but if for instance as happiness it was my first try in this I asked the marketing Circle which is a strategy that we have that also goes in the direction of governance this circles which is Circles of the Legacy departments in that in a business we have it from the community so the community are handling our marketing review of Grants and and votes and Etc the focus group itself can be considered also one of the circles in this structure so I asked them for hey

we have the idea of doing this idea fast which was brought by Felix for depending

which is amazing but then considering we are doing ourselves

we were talking about changing the name of the the event itself for the proposals to present their ideas to vote to be voted

so I said you know what let's not pick the name

let's go to our social media and ask the community which of these that we the five options we created here that we think it's okay let's ask them and this is going to be the the one that we are going with because it's not critical right it's something that it's nice to have and also to make the community feel part of the decision so I voted for it and now it's there it's going well and so on so this type of tear into this complexity I think it's also very important so for Less critical things less complex for more critical things more complex I would say which is Tricky by itself but which is challenging by itself but I guess it's something that we can navigate

I mean if you yeah please don't finish finishes and sorry no no I was going to another topic but please yeah go on okay yeah I I just saw the time so I guess actually happy that we don't have invited more ecosystems otherwise us would be still in the first question I would like to do another round with like the following question Thomas already brought up the term reputation so what interests me is what does high reputation mean to you and also like what leads to Highway reputation and what tools the use to measure that like maybe we can

um touch on that a little bit because I think that's a very

very important topic when it comes to to government

maybe I don't know who wants to go first maybe even Tom because you mentioned it already

Okay cool that's good because I was gonna there's something that kind of wanted to raise so okay maybe I just talk about the reputation part and

so what does a high reputation mean I think that the thing that I'll keep coming back to in any discussion about governance but particularly about reputation systems is that

the system can never be stable because if it can be stable it can be gained

so I mean there are a lot of things I think one key thing that like we see in real world you know Society governance and something which I get the feeling that like they're trying to replicate a

little bit in polka dot is that you have lots of different sources of Authority or reputation and what it does to have lots of different sources means that if one of them tends towards being gamed then the other ones can the other ones can cut sort of like come to the for more so for example if you did the obvious thing is if you have token based vote in and is one token one boat then you have whales and VCS we see this already on on polka dot and they they organize they can all organize off Jane as well and they can coordinate and so you know it's quite easy to game that if you have sufficient

was quite easy to gain that in order to dominate and you know take the governance in favor of your interests

so

so that's why you have like for example the fellowship and the fellowship is to a large degree based on reputation it's not an automated system but it's kind of like the semi-automated

so you have people who are just socially recognized as being people who have poked us interests at heart who are recognized as being technically competent

also also I think there's like quite an overrated present representation of parity there just because the Assumption has been that parity people are technically competent because you know that the company build a blockchain and but yeah I think the key thing really is that

you have criteria which are sensible but that those criteria do change over time because as soon as they stop changing then you create a magnet for people who have an incentive to game the system so whatever we said is the best way to get reputation okay you've got whatever you got PhD in computer science or you you know you made this many contributions then you can you could just say okay well what we need to do is hire someone who fulfills that criteria and you know they can be our our puppet

and or if you if you have something that says like listen how how long have you been around this this blockchain or how many followers do you have then again their things which can be gained and essentially brought in so yeah I think the key thing is to

make sure it never reaches a stable equilibrium and if it does read just if it gets close to a stable but equilibrium to have means to overturn that stability and and keep it fresh

who's gonna make the decision like what's the important criteria

well that's what's the relevant

that's exactly the reason why you need alternative sources of power

so for example yeah for example token based voting or Fellowship

yeah it's yeah I I completely agree that as soon as you stop changing

this or like yeah the system it's gonna be easy to game to game it because people can easily adapt

um Nicholson I'm curious to hear your take on that

yeah absolutely and

right when I think about reputation and all of that it is not really something that is being directly considered when we talk about the future governance system of cardano but in the end right everyone

has their own beliefs about who is competent who is not competent

who has high reputation and who doesn't right so in the end it influences

everything and

just one thing that Tom said I think a real danger in the governance system of cardano in the future is that
we might have
people that are part of every every single of these three groups that I explained previously right we inferior you could have one person or one entity that is a stake pool operator
that is a constitutional Committee Member and that's also a delegated representative and then we ultimately could reach this balance that Tom mentioned right that is not desirable
so what will be really necessary is
if you come up with a reputation system for cardano for example
is to
not not just
design it based on knowledge or on on any one metric right a reputation system cannot work if it's just one metric but it should be a lot of different ones
that's what I'm just thinking yeah
it's just quite quite various to also like what that boy cutout and Katana will actually quite similar to each other right because of both actually this interesting both have the same proof of sake
that's a constant Society right which is our Boris in this figure we're just in itself already which creates the environment already for natural reputation right because the stake pool operators and there we got they have to somehow do something further delegations right and the other ones them and can validating the blocks for all this figure it's not directly call to reputation system though it is one on a very technical site the what is interesting usually involve ecosystems SPO don't have to be hardcore developers like
to run the pool very often it's not that let's say hard Coalition and you can see a lot of content creators or what not for example right so that's a quite diverse setup on this like what's really interesting and this is we never look on it as let's say it's already some sort of reputation because I think when we speak about reputation it's nothing's else formula
a set of Archer machines which we add to something to something usually is a contribution system this workout for example operating a stateful right in this regard it's a contribution to directly to the network and there's an instantly recent essentialization and this process
the reputation itself is let's say a little bit social credit of developers fine I think what's very interesting in this regardless as well that both and this is something where I can see all the different ecosystems working heavily on this challenge something rough I mentioned before the lack of
large and strong enough community taxi around the whole governance right
because each ecosystem has its challenges you have the founding entities they started the whole stuff then you move into decentralization but in order to move into decentralization the community has to build up to develop the capacity to take over right
and this interesting how differently this manifested in political for example of the fellowship program which is actually quite amazing I read the Manifesto It's a pretty neat contribution system hardcore developer Focus but very interesting I think I said quite some things with spark you because I see Nicholas and profile Center but just wanted to drop this to the to the recording just some observations by listening to you guys this is pure gold please please keep working okay
nickel first and then roughly

thank you Felix for that and and you're absolutely right and one thing that I just thought what is the risk of a reputation system is that we create a hierarchy right
that new entrance really have a challenge of ranking up to
where where these incumbents are currently because I can see that in the current discussion on governance right we have these ogs that are very well first of all maybe the whole lot of ADA they are they have a round for a long time they have a lot of Merit already or whatever you want to call it and it's so hard for people that come in that might be really
maybe they're 10 times smarter like let's just put it on intelligence now right they they're the experts they know everything but nobody takes them serious because they
are not highly ranked yet in the reputation system
yeah just one thing that came to my mind sorry
absolutely as and I I heard Nicholas saying tries our three times about yeah we are the centralized that each or something like that right and I was okay so from our perspective we we have the same problem let's say but in opposite with opposite
a basis of the problem which is you have a huge Community but what I think that you have also is a very stricted and hierarchical structure so that's why you are some kind of say oh yeah we each on your decentralization because you have it
on our side we have really flexible structure as I mentioned it's circles experimentation and we hear a lot we do this sessions to listen to vote and Etc but what we don't have is they strong and strong as but not the big community
and then we have also kind of a decentralization ish in this sense so we have a problem with centralization but going with different source of the problem so this is an interesting perspective as well probably because of the ages of cardinal Catalyst and esnet and deep funding but it's something interesting to assess and analyze from this perspective as well
one one thing that
I I asked myself all the time like is it is it actually desirable if
for example I have a high reputation in cardano however that's going to be measured and would it be desirable or even valuable if I can kind of bring that reputation into pocket that for example like or
like
it's
yeah if you like if every maybe it's necessary that every system has its own like because it's on reputation system but maybe it's just
yeah kind of cements that Silo because I at one point it doesn't make sense for me to to change the ecosystem because I've invested so much time into one system and even though I feel like oh another one would be beneficial for me or I could be beneficial for their other system but it's just too hard to get to the same level of reputation for example
I see a lot of hands up so I think Peter was the first
yeah my mind that's kind of he didn't the endgame right so if some kind of modular system where you would
well for example just on a practical level and Catalyst if somebody has reputation within Catalyst there's a decent chance that would be a good member for deep Learning Community it's both Innovation funds it that trans was pretty well but I would somehow expect the system

where the moment you are looking for someone's reputation you get to take a couple of boxes what you're interested in and then get a custom
reputation score for whatever your query is
it's a bit tricky though like if it's if it's Hardware based for example
yeah can you even translate that to anything social based you're able to run a system so at least on the proof of identity it could be playing some kind of role
yet in my mind it should be a modular system
maybe Tom you want to go next
because I'm sure thank you forgive my Technical and competence and yeah just just a small things like so you mentioned like what what the benefits of like kind of like cross-chain modular reputation and I think for me one of because I keep saying like you know you don't want the system to be stable you want different sources of authority I think that the word for it would be that it's like an exogenous it's also reputation so it's not within this one system which you know perhaps perhaps you could find a way to gain everything in the whole poker that's governance system and but then if you had reputation from cardano for example then it'd be it'd be quite difficult to apply the same games or the same the same strategy to game it in in one chain as on the other so I think it's it's definitely beneficial was just as a form of yeah just as a form of social reputation to have reputation that comes with somewhere else
well
yeah I'm what I was thinking is that
right we have different kinds of reputation because on one hand let's think about the validators that we have on the different L ones right we have on polka dot on cardano
on all the others and
their capability of just running the system right maybe you can
draw the conclusion that somebody who is able to run a stake pool on qurano now for more than three years it's also probably able to run a validate on other chains right but
are they also able to participate in the same
social of chain discussions and and in the whole governance process
I think that's a whole different discussion right so I think
maybe from a technical standpoint it makes the most sense to start something like reputation system
yeah just just my thoughts on that
yeah on this topic let's talk we talk a lot in the web we blockchain landscape about interoperability between blockchain right
but something that is equal importantly it's interrupted interoperability among foundations or programs or grants itself in this sense the reputation system it's very important to have for instance we have here three blockchains Foundation Etc the low-hanging fruit that I can see and it's very important for us in the funding is the proof of life
so if someone comes from the polka dot ecosystem with this reputation it's already good enough for us to see so this person already did something there and the person is joining us us now but it's something that exists indeed so if they start to comment especially in the chat GP llm situations where we have a lot of comments and votings because we use a true reward commenters for instance in proposals but then we had such EPT and started to they started to bless our comments and so on not adding value and we started to ask ourselves okay this is a

real person or is a person that has a much more accounts and so on so with with this in mind if we have this specific thing
would be alright that would start for us right a proof of life because it's coming from polka dots from Cardinal ecosystem so yeah it's it's nice and then we can have more much more things for instance we can and again going that complexity our simplest part we can have for instance okay it's coming from another ecosystem the reputation so I'm going to give a 40% weight to their reputation existence reputation and 68 it's going to be from Deep funding Singularity night reputation points and then we can play with this type of stuff as well giving the enough important street so yeah this interoperability between programs and Foundations I really believe it's the way to go
same things that happened and much agree on this also Niko mentioned it before in the in the live chat as well like reputation ideally has needs to be LinkedIn governance this regard and sooner or later to the IDS as well and when I think about the IDS like I don't want to have the it for Singularity that one for policy that and one for Katana like that the fact that even the 21st century anyway so definitely a tree on this and they are challenges that's for sure looking on the time we are pretty much close today end of this meeting
and started
yes and it was sure we wouldn't go get through all the points it was so social network with such a topic and for such people in the car that's for sure I have the whole day for you guys okay Akira get yourself a coffee we stick around listen no no yes yeah you're busy interview busy for very good reason and it's Friday and you all should go into well deserved we can't hopefully you have one and quickly going under on the next topic because ideally we set okay first of all we really hope that this time actually really is a benefit and value to everybody by listening a little bit okay what is happening to ours that's it only thing what we offer to you is blocking some time
of our ecosystems right
something if we don't do it for you you don't have to do the time to do it to yourself so we are a little bit like Community secretaries here throwing you a quick calendar and license on the thing if you say this was beneficial like what we would love to office maybe a follow-up call in a month from now it can say okay maybe just thinking a little bit about hey what was this call what we sent out the email with documentary as well also which will later included and the the workshops which has been helpful
so to keep you a little bit in the loop also how this whole thing plays out
and
with this be something interesting for you to say
one month from now after invite everybody once again we can go a little bit deeper and ideally the agenda would be defined by everybody yeah so I would send out an invite with a document where you can collectively Thrive the nuts and
also amazing and I I feel like we should schedule a call just an hour for you to to share all these insights because I feel like this so much we can learn from from what's Happening inside of crocodile because
yeah that's so much focus on governance as well so I feel like
yeah we should
I personally when I hear more of that so
hopefully we can

fit that in into another session
all right
thanks everybody Felix Dominic really appreciate it
yeah great session guys great session because
it's not for your time everybody and like said you're busy for good reason take some time to come down weekends are there for a reason like like them they won't come if you don't take them to yourself yeah well
exactly we just started in the new year and it was a busy year for all the ecosystems for everybody here and we have a long run to go and the things we are walking on this topics which are worked on by Young Society of years right it's a thousand year old conversation in which we participate
and we have lots of important stuff to do so be careful and kind of yourself
make sure to not turn out you are at higher risk to do so every one of you and we need you for the long run so
governance is important but only if it's for the people so if you are not important first priority then non-governments make sense that's that take care of yourself stay awesome and thanks that what you do for both different because systems
thanks everyone thank you
but I have a nice weekend bye-bye right
