S#2 Full Transcript

DeepFunding - REPUTATION Focus Group

Workshop 2

In this workshop we will bring together reputation experts and leaders from the SNET ecosystem to explore what we can learn from each other and apply for Deep Funding.

The Workshop is part of the funded proposal in DeepFunding Round 3 which executes now a series of workshops to define a recommendation document on a DeepFunding Reputation system.

January 31, 2024
12.30 CET

Meeting Hosts:
Dominik Tilman (Trustlevel) & Felix Weber (SWARM)

Meeting Participants:

Trustlevel: Domink Tilman - dominik@conu21.com

abhishek.saxena.mnnit@gmail.com

Mindplex: conorohiggins@singularitynet.io

SWARM: Felix Weber - felix@bridgebuilders.io

hruy.tsegaye@singularitynet.io

SingularityNET Foundation: Jan Horlings - jan.horlings@singularitynet.io

Rejuve: Jasmine - jasmine@rejuve.ai

SingularityDAO & Sophia Verse: Jon Grove - jongrove@singularitydao.ai

Photrek: Juana Attieh - juanaattieh@photrek.io

SingularityNET Foundation & Ambassadors Program: Peter Elfrink - peter.elfrink@singularitynet.io

awesome and there we go
all right then I'm gonna kick it off like
have good morning good good evening good afternoon everyone so glad that you all made it today and
yeah I think a few of us don't know each other yet so I think I would like to start with a short introduction round so we know with whom we are dealing today and then we kick off the the workshop I'm really excited about that so I'm
I guess I just start so I'm Dominic I've been here in singularitynet
for a few months now and I won three proposals in the funding round three all of which have to do with reputation knowledge graphs and stuff and this Workshop is actually part of one of these proposals and yeah in addition I started last year and your company called trust level and yeah started to work on AI and blocked Shane based reputation protocols
so I ended over to Peter

you
better offering King alerts in that
remember marketing team for
some time I'm not sure look two years I think
mostly work on ambassador program and yeah it's all about Community contributions so that's why the tie into this Workshop medicine
that's it
good nice to have you Joanna you wanna go next
sure good morning everyone I'm Joanna I'm part of the food truck team where the team that was awarded to continue our work supporting defunding with developing their reputation and contribution to some happy to be here with everyone
who wants to go next
yeah
everybody knows me here okay
oh but you turn
sure hey guys I think I know a lot of you already but there's a song you
or almost seems to have some some dishes
don't care it sounds like you're in a tunnel mate
I'm just gonna carry on I'm sure Connor will figure it out
so yeah my name is John I'm director of communications over at Singularity dial previous to that I was a singularity net until Singularity does span of when I went over there I've always been very passionate about the community decentralization and everything so very happy to be invited to come over and join these discussions looking forward to it and nice to meet you good to have you and what just mean hey
hello my name is Jasmine I'm a CEO of rejuve.ai which is another singular NetSpend off focused on Health and Longevity we're not quite using a reputation systems on our protocol at this time but we have some interesting use cases with nfts that could be synergistic and I'm also a long time member of the community as well
cool yeah cool a trivia and what is well and Connor you want to try again
will seems as connections of maybe that's giving some time check back later
okay who is missing I'm not sure how to pronounce the name is it Hui
yes no hi everyone my name is Rule I'm the CEO of Mineplex
currently we have a repetition system
who tries to calculate
okay ability of users and content based on
interaction and motive behind those interactions
cool and water I guess
yes my software developer and engineering manager by trade
and I know more about
crypto and web 3 then I do about Ai No I'm busy Shoring up that deficit
so having been into
open organizations for a number of years now
I've participated
endow Stacks Genesis Dow so I kind of know

was in that context what
you know they had a reputation number associated so I can't understand what happened there with sock puppet accounts and
other interesting behaviors
I've worked to get coil for years specifically in there
Department of doing reviews and dealing with civil and since then I've been working on
basically voting power
augmented by
contribution participation and expertise factors
as as a model for
basically not attempting to have a singular
scalar reputation but instead to deal with its components
so that's kind of my main interest
thank you and I wish like I hope I pronounce it right as well yeah thank you I'm Abhishek saxena I'm doing PhD from November State University Russia in artificial intelligence I am working with Professor Anton thank you for letting me join this Workshop it will be very helpful because I'm working on reputation system like finding use cases how it can be good in any other chances so yeah this is a very big platform for me thank you so much thank you so much Mr hot
cool yeah glad to have you all here today and to have so many different teams from singularitynet I hope that will
help to have a really good conversation and discussion about reputation today I'm gonna have a
few slides to introduce the workshop today and
yeah this as I said in the introduction this Workshop is part of a series of workshops from a successful proposal and depending on three so we are holding a total of four workshops with the girl of yeah providing the best direction for the reputation system in the funding and the first Workshop was last week we were looking at where we want to go in the next few years from
from now with from the defending perspective and today yeah as I said we have various teams from singularitynet here with us and on the one hand
I hope we will learn from each other about where we stand what we do and what we need in terms of reputation and then in the best case find out to what extent there are synergies and how we can support each other to create the best possible reputation systems
so we have
about 90 minutes today and yeah we all know time goes by faster than we would like to so yeah we came up with
with an agenda I like I asked a few questions in advance yesterday some of you had time to already send the answers but yeah at the beginning we would like to give each team a short
a few minutes to talk about their own situations so we can have a good understanding of each situation and have a good starting point for for the discussion and then yeah we would open
open it for the discussion and yeah as I said first
we want to learn from each other
and then yeah see how we can support each other and how we can contribute to
a more generic reputation system Felix moderate today

and we'll briefly say how we want to do it Phoenix
the stage is yours
one moment so and because reputation is insanely difficult topic and there are a bunch of rabbit holes on pretty much it's corner and we have to be quite disciplined in 2012 approach the questions which we have also for context they are on the theory of workshops so today is the second one the first one was a week ago where we mainly focused on deep funding specific and the whole a lot of the workshops that we step by step Zuma what's more and more and like Dominic mentioned right really identify what efforts are there already what approaches exist
and how can we identify patterns are different or differences between them and see with each knowledge okay we can we are able to come up with it's an ideal is not imposed on any reputation system but emerging from the kind of from all the different ones
to keep on track where we try a specific thing like Dominic mentioned we have five questions so what we do is we mentioned each of the questions and everybody is invited to give one single answer as short concise and clear as possible to the question
not a dialogue and no answers are giving on what anybody says we go with this through all the five questions we will in the background to map out everything and ideally being that let's say hardcore straight forward we are shamans by the way welcome by the Germans we love stuff like this
types of get it it's actually a little bit through
and ideally with this we've got a very clear overview on yeah
what your current approach situation is to all this topics and this will be taking forward into a third Workshop where we Zoom totally out and go into a whole and ecosystem so we have for some polka dot cardano arbit room and have a requisition sign all the stuff it's documented and will be available at the end soon as well
to start I would come off the whole workshops so ideally all the knowledge is made publicly accessible to everybody as well and you have an easy right through that
so with that and first question actually
is very tricky one this will be hard to
stay short concise and clear on this one why actually is reputation important for you
don't have to be technical can be files officer can be what not
but how would you approach this one maybe the ones with a clear statement they call out first Young
and
I can only give for an answer yes yes
I think in the end the main thing is to build a strong Community but but I would like to add also fulfill the purpose
of deep funding which has helped the platform glow grow which we do by selecting the best proposals out there so maybe I tricked you into giving three answers but there you
I take her first one to two others we cut out at the edit later don't work
no no okay thanks love
and Pete from your sides at The Ambassador lost program
yeah would be about recognizing contributions and addressable way
it's a nice one
okay

then
next one next one I don't have anybody in mind actually
should I call people out what you like to prefer to go for
I would call them it's more efficient okay that's called people out so because you're dead already go for it
yeah I'll go so I'm going to cheat because I'm representing two companies so I get two answers is that reasonable and we don't make deals here come on okay so I mean
I would say over a singularity Dell
it's
gamification to create repeats users it gives you a reason to log in every day gives you a reason to perform more actions it gives you a reason to do more than just the task you went there to do
so it's a good funnel into additional pieces of the app or the project or the protocol or whatever
competitive nature of human beings it's something to play into with reputation
this was a pretty awesome answer let's take a second one
the second one so over a Sofia verse we're also working on governance systems but and reputation scores but that's much more to do with
creating a
solid source to track
contribution or alongside a contribution in terms of
I am an energy but also in terms of ethical stance because it's about governing the ethics of AI development
and so we need to be able to score not just those contributions that the people are doing by you know staking or retweeting or sharing information but also the contributions they're making to the discussion itself
and giving some value to people's opinions because obviously there might be one guy given just crappy crappy ethical points all the time we need to be able to Value the and value in a way that it's not us deciding it in a decentralized and ungoverned way that just automatically values these these things
Justice
beautiful set
this was nice
I'd love to bring this up all to one sticking out but
that's really good thing thanks a lot on
and then calling out there Joanna would be the next on the screen
yeah I think mine is a combination of all three so just
pay like a Synergy between like and be positive incentivized behavior by individuals and decentralization and in the realm of web 3 and this new digital landscape just being able to create opportunities for more like a shared economy and people contributing to you know shared values and making meaningful contributions to today ecosystems
for instance I think such fun
then next would be just me
yeah so I thought of kind of

three different ones so the quality of products and services being delivered oh yeah for this is for review project as it relates to Health and Wellness
um secondly would be the Integrity of the research
being done
and the third would be a long similar lines as others have recognizing impactful contributions power users things that nature like people that are really going above and beyond in their participation
I could tell how I use this school as fast I think such thing next one would be we
okay so for us we are in in the content and networking business so
repetition system will help us to understand
the reliability quality and credibility of the content itself and then the content creators
while we can also use it in a fair governance system
nice one
and
then
Abhishek
oh yeah actually my answer matters with words a lot for me reputation system is like giving more chance for small wallet sizes also to better participate in the system and it's a better governance model
even the small wallet size or a small channel can be represented repetition system that's my site
see thanks a lot Abhishek
and Connor iOS
okay I'm gonna try this one more time why I cannot let's see yeah you can hear me okay I don't know what that was them everything seems like oh my system hi and so sorry what's the question and it's like
but the first question is because speaking about reputation in your context why is a reputation system actually important for you
yeah if you look at
in our context which is US posting user-generated content
if you look at existing platforms they have a few different models like
these things like medium or Facebook where it's tied to your real world reputation and
and people will only say certain things when it's their real face there because you know they're embarrassed frankly or you know they want to present a certain image to the world and then if you have a pseudonymous platform like Twitter and people will say a different set of things because
it's a different reputation and then if you
platform would know identity at all like fourchan people will say a different set of things because they're not even damaging
a virtual reputation like a reputation of a username and
so
did this shows the bite by influencing different

by using different reputation systems we can influence how people behave and the kind of discourse that ends up taking place on the platform so in Mineplex we've talked a lot about I had to deal with bias and
low quality content so yeah reputation reputation is key to doing that
awesome thanks that kind of
and welcome
from your side
so to me
there is no such thing as a singular
reputation I think there is generally a misunderstanding
reputation is good or bad not higher low you know kind of like Hillary Putin so on it's an assessment of the consensus of the opinion within a peer group
so just pick your peer group
I mean obviously everybody from a Hitman to a
dentists have their own reputations obviously Within
relevant communities
as far as the way we're looking to use it I think there are two very distinct Fields one is within organization when the person has very strong
stake and claim
on the
organizational operation there is we keep coming back to
we want to give you know more say to people who have been around longer you know more up to speed contributed more
so so we want to
want to
affect their
voting weight and they
indecision making for the organization including the ones that influence them a whole lot
and there I've decided not to try and distinguish participation like when you show up every day versus contribution where you work on something and you know you make an impact regardless of how
and so participation clearly Fades was time
contribution probably not
you may want a grant you know you may want to invite vitalic and give him five percent let's say in your decision just because you respect their expertise so that's kind of my current thinking on a three Factor
modifier to
voting weight quite separate from that is it's question question was you know as short concise and clear statement why reputation systems important for you
yeah and so much and that's reputation systems the way most people talk about them are not interesting to me any longer because I've seen them not work too many times
what I say is you're describing two distinct cases voting weight versus basically a review system
so like for Content you want to

weigh somebody's review
based on whether you care about their opinion likewise was the
you know some kind of
assessment you know for the proposals
and again I believe that
it's more about whether you trust somebody is individual opinion whether you trust and so I don't believe in portable reputation and you know I made give some way to friends of friends assessments but not so much
to some so there is basically an algebra
of reputation
and so you know somebody running up high scores of reviews you know it's too open to
symbols and fake reviews and so on
so that's that's where I'm at in figuring it out
thanks a lot of water
then we have every one for the first question thanks a lot already what is already interesting to see is that yeah that definitely lots of commonalities already and some sort of petals the second question will ideally help us figure out a little bit more which then would be once again same wrong what are your goals and use cases regarding reputation so some of you mentioned already
but
based on this you can go a little deep on this to say okay from a user's Journey For example or users perspective really what would you like to have them as well as of them what is the experience for them right
once again we try to make it as short concisely as possible
and we should just make the same cure like last time so I would call her Ciara not and I forgot forgot to mention one thing actually at the beginning of the workshop like we are all people used to have most likely more than 100 tabs open and switching over screens like in military coups Second Street
if you are able close all your tabs and fully concentrate on the thing here because my main topic really is as well like billing let's say a collective vocabulary already on what reputation actually means right all projects you have already quite strong ideas and if what's going on on their own reputation systems and our main attempt is great to figure out okay what connects them all right where can we find our stuff what can help and benefit all of them
attention throws all the tabs and yeah show us
I don't know saying I was I was working on some messages and and looking it's perhaps but I'm sure it was very important no just kidding I have a whole list of things that we want to achieve with with reputation I just reopened the form that I submitted and an added one to them so I'll just read through that so
first of all if we can identify people that give the most desired contributions to our website to our portal we can endow them with a higher voting weight because there are more engaged and and more knowledgeable and maybe have a higher expertise so that is one thing the other thing is that if we have these people identified we could also emphasize amplify the things that they are doing on the platform show that the people with the highest expertise or the people that are most valued by other people on our platform that their contributions will get more visibility

a very technical thing is that by adding their voting weights to their vote we will also omitigate wallet splitting we're doing quadratic voting in a singularity over well the term is a little bit being discussed at the moment but we are applying and quadratic algorithm to for token balances in thinking about voting weight so there is an opportunity for wallet splitting but by adding these rapid reputation weights there it's much harder for somebody to get a high reputation on a hundred wallets for instance if they want to split it that way

we also want to reward people in an ideal scenario we would like to be able to reward people for contributions we've done so in the past and that in invites all kinds of gaming Behavior so we need to be very cautious there but intrinsically I think there is some value in being able to reward people if they do valuable work for the platform and those contributions are valuable and important so if I would have the option and go to keep out too much gaming Behavior I would like to be able to reward people for that

another thing which which relates to what water was saying it's it's not just necessarily one score but I would like to be able to filter out the right people for the right jobs whether it's as part of a circle or something within the operational layers of deep funding or whether it's a team that needs somebody in a specific role with specific expertise or background or whatever then more Diversified reputation score could really help filtering out right people which will also work on a job's Marketplace for instance

group Behavior there's also reputation this also ties into voting a little bit there are two things about group Behavior I think it's very very interesting to think of reputation not only related to individuals but also related to groups of people and to teams often the magic is in the team if you have to five best performing people in a large community you put them together they might not be the most successful team because you need diversity Etc so having reputation not only to individuals but also to teams and groups that collaborate would be a great thing on the other hand in voting behavior you actually might want to decrease weight when you see too much correlated Behavior because we like people to be independent-minded and individuals rather than group think so if we see group

think whether it's abusive or whether it's there's no ethic there but if we see group think we would like to reduce the weight a little bit

and I think in general and that's what I started out with the first question I think it all boils down in a certain way to building a strong Community if you see that could behavior is rewarded in many different ways then you're incentivized to also show good behavior and that will build and protect the Integrity of a community so that is very important

that's it

we missed once thanks a lot then

Joanna I'd have here next on the screen

do you mind

yeah sure I think for me personally the main goal would be to create to develops like an interoperable architecture that's capable of probably aggregating diverse inputs from different sources that would potentially then eventually allow you to create this score or contribution Square in a non-bias way so maybe with the support of AI and not just based on human input or things like that and maybe to be able to capture those diverse meaningful contributions that we speak about the art of just

like output it in terms of numbers or like a score so different types of participation or you know contributions in different ways and then I would also encourage plus platform affordability in some sense just for the overarching web freelance gives it into device also individuals and support them in being able to benefit if it ecosystems with their expertise across you know the what we love skip in a different ecosystems
yeah and then everything else that Beyond mentioned so I I don't want to be too repetitive
to it
thinks that's why this genre
just one would even Peaks
also try to not have love too much because there's there's a lot of overlap basically one of the use cases is providing a non-financial incentive
also to take it into voting weight we do have now a bit of a road definition based on earlier contributions
and so if you've been active in the past half year with some parameters this will give you a roll which will give you governance
and yeah this this modular system where all kind of different reputation systems or of course would fit into one bigger that's that's the angle for me
pretty much Giovanna described
nice and if she's strongly agree with somebody else set before like don't respond to it but if you say this is actually really but I second that please do so actually
well the first one comes because nobody said something before but anyway
and next one what then actually be some so again there you go man
oh it's actually quite interesting listening to everybody else's answers because everyone's looking through a different lens and all trying to solve the same problem and
I won't pick anyone out in terms of echoing because I've been asked not to but I would Echo certain things that pretty much everybody has said but maybe a little bit more context on what we've been thinking over at Singularity down in terms of how how why
um you've got from
Young side the need to
reward what I would describe as very personal contribution people who are really getting involved in the discussion
and that can be somewhat subjective in terms of who and who what when where how needs rewarding
then over a s diocide we've got almost the opposite of that where we just want the blockchain to decide we we just we just want to scoring system that works and it's just mathematically sound and we don't even know who's getting these reputation points we have no interest we just want them to know and everybody else that we want the chain to know then it goes to what you are was saying about just building this framework
which is
based in just very solid math
but having the ability to
a Yan's needs which are substantially different to Singularity dials which are again substantially different to mineplexes needs

and they could be running different reputation systems with different weighting and different scoring
but there should be in this base framework some kind of levelization that they can all feed into one greater score which is like the singularity score right so over at s Dow it's just purely actions taken Services provided get your points you got 20 million everyone Yan side that 20 million might be three
as long as we balance that 20 and that's three
it that compatibility layer is what's there and then cross-platform across project cross whatever cross requirement across need correctly but we need to build that underlying balancing engine that takes all these different solutions because there's not going to be one solution fits all but there can be one one level above all below it that does fit all and brings it all together into a single reputation score for
benefician AI essentially and at least I think there's a couple of problems to solve but one of them is the balancing between all of these different requirements
nice one speech it definitely have some speakers talented that's for sure then
what's next
then
I was given to into taking and
we had first young Joanna Pete Shawn was to think so just
okay yeah so our goals are are one of them I can see kind of related to the previous kind of things I highlighted one would be kind of a line of production verification whether that be up and coming longevity drugs and Therapeutics or even existing supplements so kind of being able to verify you know where ingredients are coming from and what processes are being used and kind of Integrity of the companies themselves
and then that kind of goes right into the next one of scientific validation you know not only of products but of studies that are being done being able to verify that they have kind of rigorous scientific processes and good ethics and mitigation of bias and conflicts of interest
and then on the community side it would be for the governance because as the kind of rejuven network matures they'll be more need for different governance and as it becomes more like a dow and they'll be able to work on you know building out these or building upon these very same Concepts that we're kind of laying foundation for it to be able to continue these out into the real world
so those are the I guess main goals that I can see in our project
awesome thanks that's just me
next one would then be we
I like to say this name actually because it's like we installment we say when when you're happy about something that's good
so for us
well the gold Mineplex is a
what we are trying to build this
a collective brain or you know this warm brain so
getting people's attention matters in our business

of course getting people's attention is not going to be difficult if the values or what you are offering has no standard you know what I'm talking about because you know today's media scenario or social media scenario

so what matters is how to get a meaningful attention and this is what we call

a meaningful mental capital

because after all everyone in this planet we interact whether it's on social media or in your friendly bar or it could be in your library your reading when you are reading your interacting with the writer when you're buying your interacting with a product makers the service providers whatever so how can we make a meaningful mental Capital out of all these interactions

is objective for Mineplex and then

you need to have kind of retention system so that like I said

getting the attention is not what matters but getting a meaningful attention is what matters in this scenario also we have this repetition system and

whenever people interact whether it's social media or like I said maybe the office in the bar

it doesn't matter we have motives we behave in certain ways and this certain ways are governed by our motives what are our motives for this particular interaction type for example Walter was mentioning that reviews are fake or things like that so why are users giving this bad review that's like

before you answer the high if you know a little bit about the motive it will give you a more clear understanding of the high and then again you can also understand whether it is fake or not because sometimes you cannot just say this is fake or this is actual before you have a clear understanding of the motive

so our objective

in a net Shale is to create a meaningful mental Capital which eventually can contribute you know to the singularity as same online media Community you you can see the potential that's millions and millions of people can contribute something meaningful to the benefit of all humanity and then to this coming Singularity and we also believe that even post Singularity information will be the only constant I mean

right now we know a little bit about reality I mean carbon-based life forms are dictating because we are the Supreme nature in this planet but what about the post Singularity if you ask me the only constant will be information whether an information exchange between two computers between two biological life forms between a computer in the biological life forms it doesn't matter but we know that information is a constant post or before Singularity and

you know measuring the retention of this information objectively and accurately matters a lot for us

this was a beautiful philosophical deep down thanks a lot here speech you also you

can send it difficult to map this into a single sticky not but I do my best give me some time no problem welcome to the Mineplex

awesome

then we have Abhishek

you like to go for

ah yeah so I see that everyone is from Singularity net so I'll discuss about my goals which I was doing in PhD so we had discovering various use cases for weighted liquid rank reputation system

the one which I have completed and published was Finding kind of an opinion leader on cryptocurrencies talk on Twitter data set
we found that after liquid rank weighted weighted equal rank reputation system the users the top rankings have changed completely because if supposedly there is a trend of people and large say like channels like binance and everyone they were mentioning few users
and these users were getting a lot of exposure in the community that's why they were trending very fast instead when we actually rank with liquid liquid rank reputation systems we found the users which were after say 50 rank worth the top rankers like Ellen mask and metallic I'm just giving you the my final output which we got why it was happening because these users were being mentioned by multiple channels or users on Twitter instead their number their number of mentions was low but they were very they were mentioned by many other users that's why they're ranking repetition ranking was higher and more impactful so that was our goal and this use case was finding the opinion leader on Twitter days so we found that reputation system was very helpful there
and we can see that reputation system for any and any particular use case changes a lot as it's happening we tried another use case of find a predicting bitcoin price change and volume trade in in the second project I did
here after applying liquid rank reputation system to the users which were helpful on the Twitter data set only we change according to that we found the correlation improved but it was very negligible like two three percent of correlations improved with repetition system
so this is what I have done in now that's what I have discussed and of course right now the goal is to you know better the tool for voting system in singularitynet so I I feel like weighted liquid rank repetition system can actually be very helpful there
yeah
good thanks
the first time the town Falls in today's Workshop sign of the liquid ranked reputation systems which is beautiful because whoever dies in the bunch of reputation systems and more being built every day
awesome thanks a lot man the next one that would then be water
Walter no it no you can deep dive on topics go for it man
also what I'd be interested in right now in terms of the
assessments of proposals
is to take him out of the realm of
opinions and then to predictive ability since by now we have a number of
and after three rounds and
a number of
people you know kind of deciding on it
more than once we can probably you know if we invest in assessing the outcomes of those proposals that they deliver was it quality stuff was it
towards the money we can actually see who had the predictive ability to identify
the good and the bad and then we should listen to the ones with the predictive ability
expected something much longer from you on this topic I mean come on what not and that I thought that was actually like usefully the actionable
it is it indeed us don't say that it's not

oh sure
then and next one would beat them thanks a lot Water by the way and Kana
and yeah I I work with Ray so I mean a lot of what he said anticipates what I wanted to say
another another part of our use case if you have a social media or a user generated
media platform and
the reputation also serves as a reward and it's part of the fun and it's trying to get people addicted so you know people like watching their score go up and pump that number up and that's part of
what hoax people and brings the back to the site again and again so
that's a use case that also needs to be considered that's a little different from them
from what from the other things we've talked about but needs to happen at the same time
and
yeah I mean our main use cases just simply to distinguish good quality content for bad content and have the have the best content rights and tap if you have a
platform like say YouTube these too much
content on YouTube for anybody to view as so
the issue the YouTube have as a software platform isn't even having the content so much as
selecting among the content and
the user will have a good experience on the media side if a
that media site has good content present and be
that good content is front and centers so how do you rank that content is a really core problem so
that is yeah that's obviously related to the reputation of the person
generating the content and yeah so yeah our use cases are you know something that'll engage uses and something that will rank content
some thanks a lot
this this really a really nice point which pops up everywhere in each project right so I quality contribution
they're having and whatever the contribution outcomes them actually in the end very difficult differently defined and that if the different groups for this really cool like I have to see all the different perspectives on the same topics just listening to use for this really really good stuff actually
which brings us also true the third one that actually which would be
but what did I forgot somebody
I didn't okay nice then let's go home then the third one sounds maybe a little weird like because we are we are no one's Superior and coming to you asking you on your reports or whatnot in this regard so it's not meant like hey what have you accomplished on for now it's more like
okay when looking on what you just said before
how you see already okay why is reputation this match Channel important to you and how you approach this topics
like what's have been what positively or negatively like successes or failures happen so far on your phone
towards that your reputation system
and I would go first again with yeah

but if you're comfortable since now really proud or really ashamed of everything everything is welcome no I'm definitely not ashamed so what I'm proud of is not so much the result but the fact that we have a very experimental mindset so we're doing and instead of doing research for three years and then and then develop for two years and then

we just start and so we started very early on with quadratic voting and of course with quadratic voting or at least quadratic calculation of the token balance

that that's offers an opportunity for people to benefit from wallet splitting civil attacks

so then we introduced reputation scores as a mitigation to that so people with a higher reputation would get higher voting weight and that way yeah you can make easily relatively easily split your wallet into hundreds small wallets but to create hundred substantial reputation would be much harder

so we did that very very simple by assigning ratings to all kinds of behavior on the platform and then having kind of LG algorithm that would would create a kind of average score contribution score if you want all of that has been done in Excel sheets and spreadsheets and then also the subtracting that and adding that as a as a way to devoting results was done in a spreadsheet

and what we also did with this reputation score is use it to incentivize people to create contributions also in in a spreadsheet so there was a huge spreadsheet with a large

possibility for errors and and issues ETC but it worked it worked at that stage there are also definitely limits apart from Justice scale and reliability one limit is that we would never be able to have something like liquid reputation in a spreadsheet so that that was very clear from the start

another thing that we encountered which not completely unexpected or at least it shouldn't be unexpected is that people try to gain the system for rewards and actually I think that mainly

can be attributed to the fact that we put rewards based on agix at first at least

and then suddenly our token 10x

so those rewards which were quite modest when we I defined them we're certainly quite substantial when they were paid out and then that attracted new people thought hey I would like to have peace of that cake

so yeah last round we had a lot of bots and stuff and what we did there that's interesting I think we said

you know I'm very experimental some of the community don't like change that much so they say young you have to do what you promised so we said okay we promised we'll do we'll use this algorithm so we'll pay out the Bots and scammers because we promised okay let's do that

but after that after a long process with the community we also created a menu reputation score so we asked our review Circle to assess and evaluate all contributors and contributions they did that by use of some algorithms still but then they evaluated manually piece by piece and and it wasn't done perfect but it wasn't a nice counterbalance with the completely algorithmic one

and then we we just added and we gave those people an additional bonus we said we just want to let you know that we appreciate you a lot and despite a previous amounts going to bots we also want to give you some extra benefits and there was appreciated also I think a lot by our community and to be honest when we're going forward I think in the next round and around after until we reach a state where our reputation system would be reliable enough and and resilient enough against gaming if we would ever go reach that I'm not 100% sure I think this is a good way because

you can still use algorithms but you will have human assessment on top and it will also open up a little bit more surprise Factor we you could have a scene without saying that in advance after each round you could have a different emphasis you could say this round we will do something special for all our new contributors because we value them so much or the next round you could say this time we want to put the people that that create really long contributions or insightful contribution so we put them on the stage and maybe the third time it's something the people that only do a few but very insightful or whatever in the next time we want to do the most and if you are not saying that in advance it will be very hard to gain and it will be like a real bonus like a surprise like something

extra and not purely transactional and and calculated so this is what we've done so far or we also after the reputation the Excel base the spreadsheets based thing we had the team of Joanna and photrek built an automated version now we have migrated to a new platform so we probably need to adapt that automated version as well it does basically the same thing as the spreadsheet but it's easier configurable makes all kinds nice graphs and there's less room for error I would say so that's a small it's a proof of concept I'm not sure if you will build on it but we will build on on the code but we will build on the concept and the ideas behind it

I hope that's enough and not too much

oh yeah I made a bunch of stickies all that exactly

thanks a lot thanks a lot and then already to the next one who Next One on the screen right now

right yeah let me know if I'm super loud and need to meet myself there's Builders downstairs and you can hear that awful drilling that I can hear but hopefully not

do I sound alright or

yeah it's okay

okay cool

so

going back to what we discussed in the last question about how there's lots of different requirements for different types of reputations systems across the ecosystem within our projects there are also various uses for these reputation systems so what we've done over a singularity dialysis we've broken them down into

specific goals so we need a reputation for our Launchpad so that there's an elegant solution for people to gain access to that Launchpad we need a reputation system for our voting so that as yam was speaking about we don't have these for lack of a better word unfair scenarios where people with massive amounts of tokens can just out vote people who are maybe more dedicated there's a whole number of I'd say maybe four or five use cases that we have just in Singularity down alone

so what we've done is we've broken them down we

I don't use the term sold because that's definitely not the case but we've we've solved at least the foundation of how we want to do the reputation on the launch pad which solved at least the foundation of how we want to do the reputation for staking and on chain participation with all to some degree although not as close the reputation system for the Dow and voting

and we're actually just about to put out and be proposal to the community to bring this in

so we've got that figured out what we're working on at the moment is

how to track it on what we can track whilst remaining immutable and trustless

there's certain low-hanging fruits that are fairly easy to track on chain actions being one anything with a Twitter login being another for example and this good solution especially because we're on ethereum to track all of this in one place like on D Bank you can just get all of that in one place in traffic on a single solution so we in terms of our needs we're pretty confident we've got the base level

that now is Shifting Focus to how do we balance then internally with these two three four different

types of reputation and that's what we're focusing on at the minute is getting that balance figured out so then we have the s-dial rep score

then we would in theory or in Hope have that built in such a way that it's compatible with the s net rep score in some in some scenarios because there will be crossovers as well like our dowel solution

maybe good for the ethnet dial solution or vice versa it could be that we see what you guys come out with and we go can we steal that please you know or can we combine the two or whatever

it's it's kind of a shame in some ways that everyone's working on these things in silos but it makes sense because everyone's working a at different pace be with different priority and see with different goals though it's inevitable but yeah so we're accomplished quite a lot honestly we've got like papers we've got proposals about to go out with the new systems they are not Advanced they are very simple get the job done set that Foundation layer and then expand okay

but this one thanks stop some and one question do you have some material what you feel comfortable to share as well

I don't have it prepared but yeah I mean I was gonna bring that up with the next two questions that we have a lot of materials that we can share with the group yeah oh that's what they could to get someone a throw everybody everything in and then

oh don't do we have this years to read through all that I know we have ai could yeah so we can do go through the stuff and

look already our key code what is in there maybe dance well thanks already about some and after that song it's swalla

yeah since we're very heavy related to what yarn mentioned in the Deep funding work we as for Trek automated the contribution scores from the voting for from The Proposal portal and from that there's a lot of lessons one is that we really need to focus more on the architecture and what that would mean for the greater system and how you know we need to develop something that would we can keep develing on top of so that was I think a huge plus and then the concept of like one of our team members at the time created these graphs like John mentions to analyze Central City or centrality algorithms to see how different nodes affect others in a system and that was like right off the bat you're able to analyze how different community members and their actions are correlated so that was also very interesting and we can build on that top of that and then yeah just like we've been

slowly building a more comprehensive plan for deep funding and its reputation and governance and how that would fit in with the greater astronaut ecosystem and how your reputation independent could enhance your involvement in Estelle or vice versa and everything that John mentioned as well

listen thanks a lot

it's actually funny because on my screen is first yarn then Sean then Joanna all the cheese with a
but with the screen and Pete's this next one
it seems like everyone so I keep dropping in your list so Mom but that's fine yeah and so it's after change it's p so there you go oh good yeah no accomplishments it's a bit too for them one way it feels like we're only just getting started as I mentioned like for q1 we're now experimenting with having a governance role based on contributions of time but yeah one of the achievements would be having that data over time for the past year and a half-ish we've got I don't know the exact number but it's I think four five thousand contributions tracking on chain methodata
so that's in itself quite an accomplishment just the step of like the next step what you do with this data that's where we're at right now I would say
also Felix you yourself at a voting experiment based on this data set
but yeah so that's that's still early there and
yeah I think there's a ton of value and I think there's that it's just I'm figuring out how to use it like it it is labeled like stuff like if you do a video contribution or
anything like a community communication project management tasks like the this is all it's pretty rich data I would say
yeah another short remark on what John mentioned on basically siled approaches within the ecosystem I think it's
it's always like that I feel like first it diverges and then it's hopefully and this type of Workshop will help there
also converges letter and I think we're getting there
that's about it check
it's a great and thanks a lot kid
and because that's interesting and pastors program really say that the contribution system is in San Diego advanced IT reputation to exactly what to make out of the confusion this is something whatever that's already quite Advanced so it's beautiful to see
then at Walter
what is next one
so let me speak of the
negative side of the
this type of reputation in the Dow decision-making there is already between the founders you know also known as core and the community you know the masses
there is already largely impervable
barrier
and while our intuition says that people who've been the longest contributed most they're most active our best prepared to make decisions but that also pretty much seals
the organization and to you know political viewer centralization and you know all the reinforces these people already have
in all kinds of authority and popularity and control and
stake in it and so
they already make all the decisions anyways and I've kind of studied it and it's interesting just how concentrated the decisions can be in terms of

you know one person always ends up on the right side of a proposal you know the one that they wrote against always fails and the one that they would for always passes which makes you wonder right why human bother voting just us that person they already control the outcome whatever so whatever means

so that's that's the downside there's basically if you amplify the voices that are already very strong you're doing away with your diversity or

getting rid of your non-core stakeholders

actually really like that you point out some of the

lots of Tricks the rest of any reputational system right for example the whole thing with popularity because after all we have social security tests we're still humans we can use the best tech

stand up on change our mindset

and that's definitely massive jobs and Things Not For This Walter and next one then on and also reading the live chat because it's true we are already 20 minutes

before closing

and so we won't get through everything but seriously everything what she's got so far from you already is definitely it's fine us so therefore thanks a lot already and maybe we simply go as far as we can

and stop at the top of the hour

yeah my suggestion is that we put together at the last two questions yeah exactly like Peter said so and then everyone just give a brief answer to that and then we see how far we get

thanks okay let's do this firstly to class this one again and still on the what if you're complete so far next one would be Cheesman so we make the last round and in the next one we try to combine the ball and for

trustment

all right well yeah these are a bit of a complex architecture and we're short on time so I guess I'll just mention the overall ethos and you know everything is on our site if you wanted to know a little bit more and they're not already familiar with it but so we don't actually have like reputation system per se but we do have something called a data nft and a product nft

and those are kind of already written they just need to be audited and so the data nft serves as the kind of identity token in the network as far as we being a part of the research initiatives and also permission gateways to kind of a share data with outside entities and so that one alone is not really as amendable to reputation because there's sort of you know desire to be a little bit Anonymous sometimes and that's where you know that kind of goes into the next subjects as well about like having generic systems but then we have a product nft which is the tracking of the person's data to an actual incepted products that comes to be and that one's a bit more amendable to you know the reputation aspects and kind of the preservation of you know a privacy there because it's connected to you know their own data NFC of like

kind of a weighted percentage of how much was contributed but the data itself is sort of still a private entity that's only linked via hashes

and yeah so yeah we're definitely

you know looking for Solutions even ahead of us kind of having this whole

network in action it's always good to have these things planned out at a time

some things up testing

then we all could wait
okay so on our side we have started with a
with a with a measurement in how we can understand the motive because we are going to focus on the accuracy of our repetition system because your repetition system should have adaptation for users to give you a meaningful attention or to have our objective which is to to gain this meaningful mental Capital you have to have an accurate and an objective repetition system we have integrated with blockchain so we have a reputation token a kind of soul-bound token
which is a net transferable in any way you can't buy it sell it or you can't delegate it and then when it comes to the accuracy part for example yarn was mentioning the problem about users you know creating or appointing boats so that they can collect as much repetition points as possible for the reward or even water was mentioning about this concentration of repetition and then once these people are beefed up they will be no room for other users so in our case our experiment starts first with
for example like I said the motifs and then the boats in the case of yarn are called in our case Association bias these boats have a motive there are stated with certain users they're trying to benefit a certain user so this is what we call the association bias which are repetition system considers it will try to map out which user it could be both it could be a human it doesn't matter what's the relationship between user a user B and actual content another thing is we have this categorical repetition in the case of water for example you can have like 200 or 300 or 1 million repetition points but each of these repetition points will also be categorized so if the Voting is for example how to hunt these
most of us here are not Hunters were in the tech business so our repetition in that category will matter even if I have one million repetition points if the topic is about deer hunting what's my specific reputation in that category we also be considered so that they will always be a room for you actual experts in specific topics
we have several API points in several interaction types so that we can collect these things and then the system will try to sort it out in different categories
and then similarly on the association bias we will try to map relationship between users relationship between the user in the certain topic we are also experimenting with cognitive bias because
the walks of your life your education your background
we also have the tendency to create this bias whenever you are interacting on certain topics whether it's voting or giving a feedback it doesn't matter so we are experimenting with these things we have seen some good results on The Association on categorical repetition and things like that but when it comes to the cognitive by the saint more deep parameters like that there's a challenge because first we're decentralized platform which means we don't track your identity we don't track you on other websites or your activities on other platforms so the data we're going to collect
regarding to your background or related information will be a little bit challenging as a decentralized platform we promise our users that were where we don't care about their identity all we care about is their behavior on the platform which means you gave me your consent when you create an account on my platform and then what you behave on that platform is is going to be going to be tracked by this repetition system

so
yeah of course getting quality data for this parameters will be and is a challenge especially if it's related to your identity or to what you
do or other platforms just like Corner mentions for example some users behave in a certain way in a certain topic or in a certain area so tracking this will be really difficult especially if you are a decentralized platform but it's durable because like I said for us the two important aspects are
the motive
and then how you can measure that motive and then how you can distribute it in different categories in different topics so
for the last nine months our platform has been active and then we have tried and experimented with this parameters so long for example we we run different giveaways on different platforms and then users will come to our platforms and they will start to interact with content they will give you comments or they will give you thumbs up times down blah and then we know that some of the users are not giving you a meaningful attention they're just giving you these feedbacks or interactions just to collect this giveaway rewards it could be 25 Ajax for 100
Apex it doesn't matter but if their behaving in a certain way you can understand their motive in this case their motive is to collect the reward or like young mentioned the boats are helping the users so that the user can win the round or the user can't collect the Ajax reward for the interactions so in some aspects our repetition system has worked very accurately but in some aspects like for example like I said the cognitive bias site we are not there yet but we'll we're still experimenting
so really beautiful deep dark
thanks a lot sweet
then next one would be who's on screen right now at Dom no don't not and so
me I think I went on this one
you went already why are on the screen I'm not sorry
okay then Abhishek
yeah
so I'll take my projects on these so in the first one we were finding the individual users reputation which was more important for the use case for finding the opinion leader we were able to accomplish that
and in the second project when we were predicting bitcoin price change and volume traded so we analyzed the user reputation and as a cumulative effect of the whole group we can say you're finding what is what will be the impact on the bright how we'll be predicting bitcoin price change and volume training so we were able to accomplish that also as I told before means there was very less positive correlation waiting from two person to three percent only but in few cases we found that volume traded was more correlated to the group sentiment analysis was already done and over that when reputation system what's the accomplished we can say like there was a positive impact but I cannot say that the big impact to implement that kind of system and
at least in bitcoin price change and volume traded correlations so that what we have accomplished and we were working on other right now I'm working on stocks because Twitter data set like users are more

having more knowledge about stuff there is more debate about stocks so they this sentimental analysis on stock users is better so I'm trying this as an experiment as the next project
nice example
at the time miss someone from this front
I think Jasmine and Connor
just me please go ahead and after that Connor
thanks Tom
I think I answered this one already and let's run to the fourth
oh sorry then it's just Connor
and yeah what we accomplished well we we have a platform and we have
some users and we have them posting content and getting reputation scores so we do have a live and active and
reputation system with
with real real easy
so yeah well with accomplished quite a lot like we have built and deployed it and actual reputation system and we
created some
incentive programs where people get coins for like
early sign ups I'm posting content and
a lot of people were posting a lot of low quality content because they were just trying to game the system so
I think we really it's too early to say yeah well our reputation system works if it actually creates the kind of content where we want we need more data to that
awesome thanks a lot coming
then
like I guess yeah we're running out of time and the first three questions were meant to be Obama and the last two questions were I guess more the
the type how we can support each other my suggestion is that we organized around too for everyone that
sees these value in it I guess Felix and I will
put together everything from today and then
yeah my suggest a second date in the nearest future if that's
of interest for everyone
my site would be okay
Pete says two because yeah well we know everybody's fairly busy already and if you're busy for really good reasons and you should should be busy for really good business so we don't want to take you off from that
but yeah if
and we through the whole thing
that's something what
where you see it prints value to you then
yeah don't would be fine for you yes sure okay good
so let's consolidate everything from today and
yeah we're gonna keep you posted

but yeah I hope it was very valuable for everyone it was for me very very interesting to just listen today and see like what everyone is is doing I think many many great initiatives and a lot of good thinking around reputation and yeah it's such a complex thing to solve and it needs many rights brains to to solve to solve these challenges but yeah I hopeful I'm hope it was valuable for everyone and yeah thanks everyone for for joining today

no maybe my thoughts in the next meeting we could focus a bit on the architecture and design of the ideal reputation system whatever it is and maybe compare designs that for instance mind like either now already have and that we are thinking about that we already signing and see where they overlap where they differentiate how they could be plugged in or help each other so I think that would be very valuable thing

yeah very much agree

and maybe to make it the meeting effective because next time we'll also be short in time no matter how many meetings we have we can spend weeks this topic alone

maybe she think about what we can already deliver before the meeting so that everybody comes in the meeting already with some kind of mental conceptual idea of what's going to be discussed so get to the or more

here yes okay and see if we can carve out another date I I'd like to also from my point to thank everybody for that time I really appreciate it some of you I know we're having a heavy fever others had to get up at 6:30 in the morning I won't put any names here but all of you very much appreciate you I hope this will be indeed one of these things that can bring us together even we might not build the same system or whatever but at least knowing from each other what we are doing and where we're heading would already be there yeah benefit and value

I'm sure actually at some point we can also

not diverge but what's the other one convert convert again on both systems and processes

thank you amazing thank you we will keep you posted and thanks again so much for joining and contributing to this

wonderful Workshop

so thanks she likes and Dominic for arranging this and for your wonderful initiative

some guys much of thank you it's not everybody thank you everyone it was really nice to see you again so that's me everyone thank you guys

bye
