Session #1 Full Transcript

all right welcome everybody
small group but that gives us all a few more minutes per person to talk today
yeah we are here as this is of like first Workshop around defending reputation Felix and I got this proposal and yeah we have set up for workshops in the next two weeks and this is the first one and today it's the inside perspective as we as we say to yeah brainstorm a little bit on
like what's kind of reputation matters like starting with a big picture and then at the course of this this Workshop narrow it down to
what's priority and what's where we can set the course today and where we need more research
and the second second Workshop will be next week where we have some experts from the esnet ecosystem and then we have another one where we bring experts from other ecosystems together like polka dot cardano and probably arbit room as well
and then the last one will be an open
open workshop for the community which might happen in two to three weeks
and yeah the goal as I've said for today is that we get a very good overview of what is important in terms of reputation and defunding and especially I think the the last few weeks there was so much movement around reputation
and I think it's good that we have some time today to bring all these different thoughts together and yeah see and discuss what actually is
also important for for the MVP version of the community engagement is true so that we just get a good good sense of where we are with all these all these ideas
so we have 90 minutes today are up to 90 minutes I think Young you have to leave a bit earlier right
no I think I had another meeting that was moved or something so I can stay for
the whole meeting okay cool
so like the
the idea is that I've prepared for main questions
and that we
use like around 15 minutes each to brainstorm around these these questions and then yeah come up at the end with some
some
yeah outcomes or recommendations and so the sort of and we start like very broad so the the first question is like what kind of reputation matters so and I really want us to think in our possible Direction like which actions should could lead to high reputation to lower reputation so that we just
yeah said maybe a little back from all the discussions we had the last two three weeks and really think okay what what kind of reputation exists and then we go as we go as we move forward we narrow it will narrow it down and we'll we'll talk about like what data like when it comes to reputation it's very important that we have a track record otherwise you can't build reputation and when we think about two years ahead so like what data
would we like to have in order to build
a specific reputation and what data we should studying to collect today in order to be able to do that so that will be and the second question and the third one
will then
so then we collect all the ideas that we have and start to prioritize so what is easy to implement what needs more research what's priority what's just nice to have so that's going to be that part and then I want us to talk a little bit about architecture and considerations that we
that's you know we should do today in order to incorporate all these ideas and then
yeah I think
we
hopefully have a much better better feeling and overview around all
our ideas and and plants around reputation and and also the community engagement through
um let me see if I had another
beyond your shirt ends up

yeah please yeah
one question it seems to me that reputation and voting are
being mixed up a little bit so we talk about sometimes we say that we're talking about reputation but we're actually talking about voting or vice versa how do you see that in the terms of this Workshop
like what watching is is part of it but for me it's yeah and a lot of our conversations and the last few weeks we are more on watching actually but
I think yeah
on to speak out voting is more like
a use case of how can reputations be used from our perspective is much fun saying okay for example voting is one use case what other use cases could there be and how could this very use cases ideally support defending Mission and processes systems
kenrik defense
yeah another way you can think about it is
different types of voting systems have different vulnerabilities to reputation
you know too so you can think about reputation as a risk
and so for instance you know like one of the premises in blockchain is that you can arrive at consensus even if there are people who are seeking to be malicious
and and so you want to
part of it it indeed could is a separate project but
you can think of one of the requirements of a voting system is to reduce
your risk of you reduce the vulnerability to reputation risk
so the to the extent that the voting system is designed that
even if people have bad reputations and seek to do bad things they don't actually have the ability to hurt the community outcomes and that's that's a positive feature
yeah I think Janet does it will become more clear when we start you know like we have prepared a my robot with some some guiding questions and
I actually maybe maybe if least you can can share the link I will just screen share share the memory board so you don't have to
be active what we try to capture the conversation there and try to visualize it what's happening on
on the vocal
and part here
I'm
gonna share it
one second
where's my
sorry that's not appear
yeah
reflexing on that question I think for me just thinking about it it will probably be very hard to isolate the two discussions whether we are talking we could make and we could determine in this session to just talk about reputation and not about voting
but I'm not sure if I will be able to manage and I'm also not sure if that will be the most productive way but
it's your show so I'm happy to accommodate whatever you think is most helpful
well maybe like cow voting behavior affects reputation but not how voting is implemented Within
the system I think that's I know that there pretty
correlated but maybe how we can take into account how someone votes and how that affects their reputation
yeah yeah exactly that's that's perfectly said so like the idea was that first I would ask you young to to say a few words about like what's actually the goal of defunding and then
like and we have already talked about that but it gives us kind of an idea what when we talk about reputation okay that must it needs to be connected to our goal and then the second question will be like what actions
can lead to high and low low reputation that's exactly also it which one I said so what voting behavior could could be one part but
we can think about like different roles and processes indeed funding
that
can

and and actions related to this these roles and processes can can lead to high and lower reputation so the idea of this this part is just to yeah
take a step back and think of much more than we we might have discussed the last few weeks and just to see if we missed maybe something or is there something that's also might be important in in a year but it also makes sense to think about it today
so that's that's the idea of this first first question
okay you want me to kick it off
yeah
sure of Defending I think I already saw it in your opening shot and thought that was well captured if you really want me to to take step back
well the further step back I can take is to help bring about beneficial artificial general intelligence right so I'm not sure if that will be very helpful in this perspective submitted below it too high level but the two goals that are taken from that the first is and that's more deep funding we want to help the decentralized AI platform grow
and
focusing a little bit more on that is we want to make sure that valuable
high quality services are created for the platform and we want to have applications developed that use those services on the platform I think those are so in in general we want to have usage of the platform there's a very important thing
and the second thing is we want to create a community of Builders as I call it and builders in the widest term of the widest of the term like a ux or a marketer could also be a builder in a way
um and if I try to connect debt to what what would that do you want me to reflect what that would mean for for reputation or just
keep it at this you can continue
okay so one interesting perspective that came up in the town hall yesterday was somebody from undamio saying well we also need to have reputation on
people's skills
so I'm thinking on having this my job Marketplace and it would be helpful if people
if you would be able to to somehow have an indication
of
how well a person would fit to your needs let's put it like that and reputation could play a role there
another very interesting perspective but but this is really a fake one that I haven't drilled down and I don't have a clear idea how to embed it in our system but so that's probably for future use but
I was impressed by that book of Eleanor Ostrom or based on the work of Eleanor Ostrom and about that picture with the two chicken cages and the benefit there was that it's it's about team it's about a group and I completely agree with that and I think that's something that we're still overlooking you know like I say I don't know exactly how to implement or where or whatever but it's something to keep in the back of our head that also
maybe even ad hoc collaborations or long-term collaborations of people could somehow also gets a reputation
so that would definitely tie into that second goal of deep funding creates a community of Builders I would say also the first one
then another thing is that in order to have a healthy community and and sure high value for projects landing on the platform we would need to
it would be helpful to have good
feedback system
and if we could tie that to reputation and and if we could be
have a higher confidence that whatever rating is assigned to a project in our portal for instance Roots would be realistic and fair
then that would open up all kinds of opportunities for instance we could filter out projects that are below a certain threshold and have the community vote only on a subset of projects just as an example
yeah or we could do it more organically and and any Community member can just focus on on the top 10 of projects in the platform but yeah we would need to have a pretty high confidence that whatever refusion ratings are are created would be
yeah and dependable
and other use case

for reputation well going to the area of voting and how we're using it right now is as a mitigation to wallet splitting that's one one way of looking at it and another way of looking at it is saying well the same way as I mentioned in reviews and ratings if somebody has demonstrated a very good
I recall it assessments assessment quality
then maybe that should also be reflected in their voting weight so that person's vote has a higher weight than other people so not just for Mitigation Of wallet splitting but also genuinely saying that it's not just tokens that matter or number of people but also some kind of expertise whatever that expertise might be
maybe the last thing right now on my mind and that's all a little bit further away
deep funding is about this community it's about
grants that need to be voted upon
but there's also the program itself and the governance of the program itself
and I can imagine that if we are going into a kind of voting system or even maybe not even voting but a selection system where the members of circles will rotate as our hopefully our community will grow over time there will be more candidates and maybe we'll get to a luxury position at some point that we need to filter candidates who want to be in a circle
um yeah having a kind of reputation that says something about how applicable somebody is what but the chances of success how engaged somebody is for instance would be very helpful there
so those are very very different dimensions in which you can use reputation and each of these Dimensions would have another meaning of reputation could have acquired a different
rate for instance
you know things things in kenrik
yeah particularly when John says to talk about that last application
I and maybe this is part of another later in the conversation but at some point it would be good to talk about
the issues around self Sovereign identity
because I have a concern that
in trying to build a centralized reputation database which is kind of the approach we're currently taking
we're setting the community up for huge set of vulnerabilities
and
the community itself might not be the ones that would directly manipulate and abuse the database but
you have to expect that it can be hacked and
be misused
and so
that's why my email about this I asked about the security issues
that
from my perspective it's an extremely high priority to get away from this idea of centralized processing of these reputation scores and move towards a
you know people having kids and then self-sover and identity controls and somehow if if an identity reputation
is going to be made about people in the community that the individuals have some control
yeah I agree if I'm a comments on that to perspective here
one perspective is
and also yesterday some sometimes and and I haven't completely crystallized this idea from myself but I was thinking we were building this huge machinery
and how much of that machinery
could we do without if we would just be sure that this person is a unique in the video and he only votes once in our system for instance so if you would have that kind of identification wouldn't it make a lot of other things unnecessary
not everything of course but some things and what is the balance there you know what what do we want to achieve so that is one perspective another perspective here is that I agree decentralized identities I agree that you should have ownership over the these identities the latest initiative of cardano is interesting in that respect I think maybe we can tie it in somehow
also our own very modest wallet linking tool might have a role
nevertheless
if we and and this is this is a recurring theme if we are putting more and more things on chain and yesterday I had a discussion related to the treasury guilt and whether we should use that process for everything and all our circles as a side note

if there is more and more and more and more behavior of a person related to some Pluto ID
that is a risk in itself because I don't believe that Pluto IDs will be secret for all of time I think at some point if somebody puts enough effort in it it will be possible to link pseudo ID to a person probably it's not even that hard as we imagine especially not if you have all that behavior because that can also tell something about who the actual person is
so
like I
should be we should be aware of that and and I think at some point we should make a decision what we think is is safe and what we warrant and whatnot I mean I am on YouTube movies all the time and saying all kinds of things and and there online and everybody can see it and no way I can remove that or hide that so maybe we shouldn't also be overdoing this but
yeah I feel at some point we need to make a kind of decision there
can you you wanted to add something
I know I agree with what John
okay
no
these are the kind of risks and about that you have to think about
right maybe we can
take a few more minutes to think about like more more
think of I think more of actions when we talk about reputations like we already talked about certain voting behavior and stuff but maybe
I think it's it's helpful if we
really just think of think of actions that
should impact reputation or reputation should should be linked to to certain actions before we move on on what data we actually should start to collect or would
shall we just call out and somebody will that yeah so we we already have voting so one action that that comes to mind right now is visibility of actions on on the platform so two way street your activity will feed into your reputation but potentially your reputation will also influence the visibility of your remark so it could could be surfing quicker if you have a high reputation so that's one thing
another action would be selecting people for certain roles whether it's somebody in a team that wants to add a team member or me as deep funding staff wanting to have somebody or Circle themselves running to have a new member for for their Circle
when I think about like roles for example proposal saying I guess when I
achieve my Milestones or complete my proposal then that's should could or should impact my reputation as well
or when we think about the reviewing process some that process might change over time as well so if I for example review a proposal and say okay this is very promising and it turns out that it's that it fails so that probably should lead to a lower reputation in regarding to reviewing but when I for example
say okay this proposal
I think it's highly highly likely that it's going to be impactful and it turns out it is impactful then that could also impact my reputation
for selecting
which proposes
I would like to add here that this shouldn't just be reflected to the person that's submitted the proposal but to all team members and our new platform facilitates that in the sense that every team member is linked as an individual to project
and this ties also into that group reputation already potentially
I'm not sure if we take this into account or if we can but it's something that would lead to probably like decreasing your reputation is if you're caught splitting your wallet or doing any of those types of actions
yeah I
think we can add correlation here as a topic as well
and
I think we should value very individualistic voices relatively higher than voices that are highly correlated to each other
I mean it has a nice touch to it apart from from a identifying gaming Behavior Etc also in my mind as she is one person saying well everybody say we are all unique in the videos and then there's one person saying I'm not

but
so I think it would be great for for a program like ours if you really fail you the one person that has a contrary voice maybe not over but at least giving that proper value
it is something
like
like I call this raw contributor but like someone that facilitates things around the community like or that's
I don't know someone that comments on a proposal and that leads to the to
a better proposal for example
yeah so all kinds of feedback on proposals both comments and reviews and ratings these days so that is that is a
take your thing just like creating a proposal or being part of a team that creates a proposal
and in that fashion I think also being part of meetings like town halls and all kinds of should be factored in and that would for instance could give somebody very high reputation if you are looking for a new Circle member
because like the more
like
those types of rep like actions that are harder to capture and I'll say this for my own experience for example I might not be very active in contributing on the portal or like doing those actions but I'm very present in meetings or contribute and research or things like that which I think would be harder to capture but also very important so it might be worthwhile to think of how we can differentiate the two and maybe try to capture those types of actions not just even participation but type of participation I mean some of the chats it matter most are very insightful not all of them but I know they're like a more closed loop very in-depth discussions maybe the people participating there like those types of distinctions
but I yeah when it comes down to it it's difficult to capture these types of actions
I have two others inspired by huge una the first is and I think this is very relevant one reputation for awarded team members and not just because which projects they participate in but also other things they are or are not doing one very simple one is submitting the monthly survey which I'm not sure about how disciplined we're sending it out but that's that's also in the
progress
but another one is for instance be participating in peer reviews or doing other things being being in in meetings presenting your work all that kind of thing I think actually that is pretty important metric
yeah
yeah because this is kind of inspired by a conversation I had yesterday is like it's very interesting to see the people that are actively contributing in the town hall or what not because it's really driven by Passion and an interest to better the the ecosystem it's not in any way compensated and I think that's very important to capture because before it starts to become like certain like
like a money or whatever is incentivizing this then it's going to be very hard to differentiate why people are doing certain things
so yeah I think like you said as well like any sort of continuous feedback that's being done by an individual that is actually contributing to enhancing deep funding I think it is very important to capture yeah they're taking out of their time
yeah and you are all good examples of that all awarded team members and all very active
but for instance the other day was very positively surprised by subir and Gabriel wanting to lead the awarded teams Circle and I think yeah those kind of actions are really important for our ecosystem so yeah we can somehow at least legalize that these are most respected team members or something yeah that would already be helpful
the other thing thinking about is maybe activity on social media so telegram Discord mattermost
and maybe not
your previous
good activity so that's another thing but maybe Daniel's tooling can help us a little bit with that
to your previous Point John are those like Circle members or are those documented anywhere are they captured like who's doing what with independent is a part of what Circle or how is that that being captured that's a good point so what I'm
what I will do what I what I'm trying to get
organized is that slice a year we'll have a retrospective on the circles where we will have a report on ours and budgets spend on which tasks something like that is what I expect now and also that the circle itself will reflect on what went well and what they learned and what they want to do better and what they want to do in the next Health

year Etc so in that sense of more generic thing already be available the other perspective here is try to what I was just outlining we had a unplanned discussion but a long one Peter and me and Rafael on
payment processes and it's a little bit different across cervical so one initiative that Rafael took is more alignment trying to get alignments between circles where possible and payment would be one of them and we have some ideas that report could be made out of that but
yeah we could have if we would I was a little bit resistance to be honest but I'm almost one over
if we would use dwork as a central hub for tracking all those tasks yeah and then basically you have what you want I think or what you were looking for
it doesn't say everything it says how many people are how many hours a person is writing it doesn't say everything about a person's value or engagement or or whatever
but it's something
so on other thing or this is also an interesting one here to capture that
unquantified value there's this option of having this kind of let's say a value token that everybody can distribute I can give people tokens that over the past Health year or something I thought had a really good contribution
so Sierra from socious had that idea and wanted to wanted us to use his token for that but we can also have our own token for that or another way of doing that even maybe un tokenized I don't know I don't care
and I feel like so would you think this is something like in line with gimba gimbal tokens if it could be replicated within deep funding or something
in those are right now are I think mostly handed out based on activities that you're done
and
we could use the same token maybe but I would be interested in having a token that you will give to people that kind of Kudos as I really appreciate what this person did maybe somebody only puts in two hours but he does something brilliant or
he has a he or she has a very high influence positive on the community or whatever by the Press just by the presentation for instance which would never be accounted for in hours or
whatever
yeah we we had an ideation project very similar around this type of topic the one question that I that comes to mind right away is the distribution like who would is it that I could
give it to that person or is it the Deep funding team like who would be the one that's Distributing that value token
because I mean there's something that could
be beneficial here like peer endorsements somehow but then everyone that come into depending have 100 tokens that they could distribute or have to think about the mechanics yeah
there's something like that or we could and out 100 tokens to everybody that
whatever is in our community somehow or watching a meeting or whatever we put there and let them distribute it or not
but it should should work in a sense that only the that only the tokens that you receive from others would count for your reputation
so holding on to them would not give you any benefit yeah and of course that can be gained as well we can we can discuss hey I'll give you mine and you give me yours and
but yeah it's one other signal and Kendrick has his hands up
yeah I
I like the way this is going in terms of an important issue because that I think that reputation is a kind of currency itself even if you step away from the cryptocurrency world that we're living in the possibility of putting tokens on it just in terms of the way human interact interaction is
there is a kind of exchange of value in the way we build reputation and like for instance John is saying like you know hiding each other on the back is sort of a way of sharing reputation
but it has very different properties than a fungible currency
and I don't know if anyone's looked at it this way but I'm I would bet there's some literature on sort of reputation as a currency and what the what the properties of reputation are
because the other Dynamic again sort of if we can get away from sort of the central repository in the central calculation
a better way would be that you have some kind of
did right and then
everyone in the community can contribute to your reputation

by somehow you know giving you points on things that you accomplish
but so then it's a much more of a decentralized Exchange
of rewarding reputation to people
but
the tricky part it just go further like again John was kind of getting at this is that the tricky part is that
with any currency you have to kind of think carefully about the constraints around it like what
what would prohibit two people from just you know back and forth just sharing
reputation to each other like so how do you how do you constrain it somehow how does it become a constrained resource I guess it's the way to express it
so very
thoughtful actually
cool might I think we could spend a whole other workshops just on that part
I feel like because we've already spent quite a lot of time on that section but I but I think it was important to just see like what kind of
like roads are
or I put it that way I think all this different types of reputation that we're just talked about are linked to different roles and I think as an as an exercise we could or
question to answer because
we don't forget it it's about wallet related reputation we have seen like how old is and wallets indeed reputation or wallet splitting behavior and maybe suspicious whatever that is trading Behavior trading versus holding Behavior I think we should keep those in
perspective as well
and specially the Wallet age I think is also
an interesting
so
yeah
not it's a good point and so when I Was preparing like this the sport I was thinking of like
four different roles like water it's a role that whatever my what my voting behavior is can lead to can influence my my reputation and I called it contributor but the question is if that's like narrow enough or or is it
or should we divided into maybe different
still different parts and then we have the reviewer proposal so my question first is is if
if we need stats
these different
roles
I think I think we do but just curious to hear what you guys think and if we need more and then the follow-up question would be like what's
what's priority right now like what's what's easy to implement and what data is
related to these roles is do we already have what what data we
it's missing what we would like to have so that's kind of then the next and the next questions that I
I think proposer I would maybe rephrase to Builder or something because it's not just a proposal but everybody part of the team and everybody building so I think Builder and reviewer are very nice it's a nice distinction there could be both of course and it's not unique
contributor
I also make sense to me but but it needs some context what kind of contributions we mean here and I think if you were so reviewer and Builder are very directed to project and I think if we put contributor in the context of the program so program contributor it would make a lot of sense
and voter yeah could technically be both depending on the vote
but we can we can I think the most common use case for voting is indeed on projects and maybe that is it makes sense to group them like that yeah yeah
and I think that would indeed is not a bad distinction like this
any other comments on that
in terms of data I think we would right now with all we have we can capture a little bit obviously on the voting behavior from the voting portal and then contributions in terms of like reactions on proposals so comments like

emotion reaction Emoji Emoji reactions things like that um this is what we I think we have in our hands right now wait what we might need to capture obviously the other stuff that we're talking about so maybe through
Daniel's tool like engagement on different social media participation in town halls like those different types of participation metrics I don't think we have a way of capturing matches yet
yeah social media activity can be both based on governance that can also be related to projects right so
not that straightforward but yeah I think we have in our current proof of concept we have where we the the already the the confusion here is that we call it a contribution a community only engagement engagement yeah so that's a third term another term yes
so I think what we capturing now is mostly the review were behave here a little bit of the Builder Behavior
so we can use that I think we're we're not doing well on the contributor part the program contributor maybe you should call it something like that
what
funding contributor whatever
and I think
I didn't give it too much thought yet but I think it will be increasingly important because we are now on this road of decentralization and setting up all these circles and this organization and I hope we also be able to grow the community get new places in
and then I put this
program contributors score or rating yeah could be very helpful
and voter yeah we can tie that to wallet behavior and that's something we have conceptualized but we don't have in a for real
practice yet
maybe a subset of contributors are like ambassadors so all the different little things that happen within the funding
yeah
I guess it makes sense to have a good distinguished up to distinguish
as much as we can in order to
have like a relevant reputation at the end
so question here would
they all kind of
feed into the same voting power output so if I am in the circle or an ambassador program or doing all of these other things I will
eventually have a higher voting power
within this system as well right
I think I would make sense yeah if you're more engaged and you putting more of yourself into the program then I think it's not unreasonable unreasonable to give you also a higher weight in voting thing and not not black and white right I mean we also need very good experts that don't have that much time to be to spend a lot of time but are very valuable in their assessments
but yeah I think it makes sense if you
are very active then then you have a certain kind of knowledge we can assume that you have a certain kind of knowledge and and understanding what is what is most needed
right
to be success
ful there
is there any data that we don't have but it would be good
accepts like the social media part that we talked about
yeah well that behave here media attendance to events we're also either not capturing or not using what we're capturing
and for those are three already
the the social graphs on wallets
you know is it is a
or in fact any of these data things
not so much looking at it from individuals but rather looking at the social graphs
are so that you can build reputations around subcommunities

because this was a this I think was one of the key points from Austin's work that really hit me that John was talking about at the beginning of the meeting
that
in order to evolve a community that is collaborative
your rewards and punishments have to be based on community actions not necessarily individual actions
it goes back to that story you told him one of the other meetings John about selection for groups of chickens rather than individual chickens
you know that you evolve you want to evolve
good group Behavior not
good individual Behavior
well you probably want to have local excitement yeah you want both but the point is that I
guess the bigger point
from that evolutionary Story the bigger point is that
you don't want to be selecting just for your highest performers
because your highest performers can be ruthless and how they obtain that
whatever the mech whatever metric you set up there's always the possibility that someone will be ruthless in in maximizing that metric
yeah for
their own personal Advantage but actually to the disadvantage of the community
yeah
one one question that's
sorry
what this tough one I think that is why reputation systems in general struggle
I think where we're coming from is a situation where people really know each other and interact with each other and a lot of things are implicit and you know who you can trust Etc
but if we're scaling this to a global system then you don't know people anymore and then you need to capture that somehow in ratings and those ratings can be
and gained and so what in the end I think makes a difference
is a sense of belonging
and yeah
definitely tapping into a very difficult aspect of this but the way I've been thinking about is I've been trying to kiss piece together like how this would work
is that
you become a member of several different social graphs right and on the one hand you don't necessarily even know who the other people in this social graph are
but now your reputation is going to be affected by that
so what how does that affect your own behavior right well I think what it does I think there's a positive thing here is it it makes you take some responsibility for who you affiliate
and it makes you take some responsibility as a group as to how you as a group develop your reputation within your community
so that
you know because and I like you're saying this is not the Western way of thinking about things like this is a very kind of Eastern way of thinking about things and it's in the sense is that you know because in the western societies we've built up this whole like hundreds years of philosophy around individual rights
but
I was Stark in reading some of these anchorology books about how
other communities have kind of built good behavior in their communities and and one of the things that really resonates is that they
it's like a group of people that end up being responsible for bad behavior rather than individual
and that the positive side of that is that
um
the group then also
takes responsibility for somehow putting constraints on what each other's behavior is

I really like this way of thinking I think this is extremely interesting and and what it's the way I could try and phrase it is
when it comes to bad behavior people are often hiding in groups in group Behavior because there's one in them in a big group so they're not visible and they can still join in
but if somehow
as you say Kendrick we could make people
conscious of the facts that they are related and tied to certain groups with certain behaviors and that would actually make make them make that behavior of that group reflects on them
so that's kind of the opposite as what would happen now in a big crowd that could be a very interesting line
of thought
exactly
right
what you're saying it it makes
the control of the reputation also decentralized right because now rather than some centralized body having to take some action against an individual
rather it's the it's your subculture that is together responsible for building a reputation together rather than as rather than the individual being kind of isolated from the group and some central body being responsible for deciding what that punishment or rewarded
in a way that this is an
Next Step almost the next layer on potentially on weighted liquid rank because weighted liquid rank does that already it means who your Associated what you're doing Etc but my feeling is that if if we could find a way to implement this properly it would be more organic than that and and and more subtle
well maybe something like
you're already connected to your team members that you
that you work on a proposal with
or you're already connected to the members of the circle that you choose to work with like those sort of connections that we already see within the within deep funding because I think it really matters like when you
whoever executes a proposal together they should I believe be very
in line with their like the way they behave and then you just more what the what they think is better
for that ecosystem because they're building for it
yeah very very very interesting direction that we are looking more to connections with other people and groups and see how we can make reputation flow in that way because it will include human behavior and it will include actual human relations and not just actions that you're doing
yeah cool
I don't do all the conversation too much but just I forgot to mention this like back on the token concept and I know like there's certain actions that we take into prevent while it's splitting but I took some time to read more on like the Soul band tokens if you guys haven't read that paper I highly recommend it because it does touch on a lot of the things that we're trying to solve by metallic return and from a technical not technology perspective it's very similar to the idea of did and SSI where you would like issue these credentials but the difference is it's a non-transferable token so it's tied to your wallet obviously that comes with this issues but because it's very community-based there's this concept of social recovery so your community can vet who you are so you can regain your credentials on a different wallet if you need to and it goes from being able to issue credentials of all this person has
attended this event to this person as an expert in XYZ I'll take obviously a way deeper dive into it but it could be something that we think about when we're thinking of how we want to represent the these sort of contributions and engagements one on trainer tie them to the individual
that's all so I'm so bound token also in the context of Mineplex I think if there's article that explains the context more broadly could you share it
of course poison
Something with this system also to look on the technical feasibility or solutions for example some stuff like this for example non-spendable assets work on some protocols not on others for example Katana you can't create non-centable assets right they have to go to other protocols and then also where it comes I think this was also conversation which we had already very often alternate regard within to the talking thing that definitely there should be a high interoperability once to reach out to within the ecosystem so to say that ideally based so any project within

the aestheticosystem can simply apply to the latest stage and as well like here on the technical layer right what can we actually do on on the platforms which I use right
yeah I think this is the this is the I think the biggest issue is like because we're solving these problems I think a little too early that we're like in theory way more advanced than the technology that we're trying to like build it in a way that it's very future proof but sometimes at least with my own experience from building in this space the end goal is interoperability so maybe we should think of it from the perspective of maybe we do what fits very well for us within this ecosystem
maybe with hopes that eventually it will be interoperable with others which I think it will be because all of this is working in tandem maybe this goes back to you on yesterday what's comment of like okay do we need to solve the world probably not maybe we need to solve our own issues in it immediately and then we know the direction of the tech is for everything to interoperate so
I think that might be a good way of thinking about it
yeah I just let's do this discussion go because I think we came we went in a very interesting Direction so it's maybe a bit of topic or originally but I think it's
it's quite important so I just
just let it Let It Go
but maybe we can use the last 20 minutes a bit to
start prioritizing like and help Joanna and me to
yeah if
to understand what we need to incorporate in and MVP or like what's what's not
necessary right now but it's good to think about just the data that we want to have in such a collect but yeah I think that it's
would be good if we can use the last yeah 20 minutes
to
actually you want I made an F note prior to this call so I can can more or less read them aloud so I think as main short term requirements I added
ways to mitigate wallet splitting I think that would be an important one and but it can be done on different ways right so it can be correlation metrics either Behavioral or transactional
it could be Wallet age it could be
reputation weights that we already have already had in previous routes
but it could also be kyc
or identification did however you want to call it
so I'm not sure what direction we should take there but but to have a measure that will mitigate the risk of wallet splitting would be great
yeah I think another short term thing what we already discussed before is we have this proof of concept if we could align this proof of concept with the new data coming out of Wordpress which will have in a couple of weeks
I think that would also both help that wallet splitting and be valuable shorter output
I had a third thing which is more related to voting and I defined it here as design a way to implement strength of conviction because we're talking about it in a conceptual way but we haven't really gone deeper into how exactly wants to do that and and
if you want to use actual payments or give somebody some tokens in the literal or non literal sense
and and how do you act of that will be if we can make people understand the significance of it and the working of it that's very important actually and the discussion that I shortly had yesterday with Kenrick and how does this strength of conviction in terms of you have a hundred Focus that you can divide of projects relate to degraded voting that we have today which is give one till 10 for every project
in one but I already mentioned that was my last point but I mentioned that in the context of the first one is
determine the benefit of identification versus other measures
so
yeah I think these are quite concrete things but we what I didn't have here what is now surfing in this call
is this whole social graph that Kenrick put on the table
so I think at the very least we should do some research there and and think about some thinking about what would be a meaningful way to integrate that and in a sense
I think Robert has already did something there in the terms of what he called centricity and maybe that was already very similar to this social graph so maybe we can revisit that or

put some value to that in some way
yeah I think that's true and also this is part of Andre the well is expertise and simulating how to communities make decisions
it actually comes down to you know agent based modeling of how communities are interconnected with each other
yeah
by
the way generic I noticed you also applied for the simulation tool
yeah
I I answered we hope to get you whitelisted so you can can the question that I have for myself I'll be with any very honest about it
as usual
is it
the right thing to do to have the same team that is work is building the framework for reputation also be the team that does the simulation I can see some efficiency benefits there but I can also see some other kind of benefits and having two different teams very different perspectives as a kind of adversary tactic almost
yeah yeah I understand what you mean that's a that's a that's worth thinking about
you know
it's a valid point I'll just say you know we'll put our proposal and and Andrea bolella it's just exceptional at this particular problem he does it completely extraordinary work on
agencies simulations of decisions
so you get a chance to see what he's done and he has a lot of Publications in nature science and
proceedings of the National Academy of Science and other very top journals on his work
all right well that's luxury we have something to look forward to I love hearing this and I know that the student from Anton will apply and they already also have some I suppose Asian based simulations ready already that they might show it will be an interesting battle the only thing I want to mention is that that it would be very good for this simulator
to have a kind of independency in the whole thing so that it's so we're talking about group thinking here that it doesn't turn into a group thinking thing
right
well we'll get some thought that too yeah
maybe there's a but like I say it's it's luxury and to have somebody Andre I don't know him but from this reference that you're giving it it sounds absolutely amazing so we have wonderful to have somebody like that also joining our
investigations here
actually Andreas one who actually put it first put us on to quadratic voting our very first project in these communities was
on deep on diversifying the voting within the Catalyst program and it was Andre who did the research
all right
might be interested interesting to to get him into touch with Anton and his team
yeah
he maybe they can can work together on some of these things somehow
all right there was a little bit it's great a diagram but still
yeah I just want a circle back a little bit to the MVP that were obviously because it's everything in a lot of Direction so we did a little bit try to attended to do a bit of it deep dive into the POC code fortunately is way more complicated than we hope so
my suggestion is we will implement the MVP as is an RFP I think we've kind of decided on that before but just maybe on its independently so it'll have its own and obviously we have to
think about this a little more but it's own database from the voting portal and then because what we're trying what we're envisioning with this architecture is a microservice architecture where the calculation layer is its own either microservice or it's a set of microservices and those are primarily just to do the calculations but then the inputs each one would be its own Service as well so now that the voting portal is it's own input in a sense it's data would have to be synthesized myself then similar with the portal data and let's say the wallet
link I
have stuff to kind of think about this I was hoping we could have some time to discuss this with other people that might be more knowledgeable from an architecture perspective but

maybe we can take it back a little bit and if there's time in another Workshop Dom or maybe we can have another adult call with someone that you know has some art texture experiences we can
find that first and see how with the MVP we can get it started in line with this overarching act
ure I was hoping to have on the call as well so
um we could talk a bit more about that but I think we just take it into another
other conversation also when with my backend developer so we can
yeah that would be great
yeah and then we can see most of what we like how we incorporate the PRC code or if it's
yeah I don't know that was there was a question of Rihanna as well did you look into the coach of the POC
I know I'm not a developer at all so wouldn't help you a lot about it was just
curious about but like because on first
like I took some time last week and it seemed quite complex for what it actually is doing so yeah John and I were thinking of
like you that's like does it really make sense to like it seems
no you apologize if you want to throw it away basically I mean I'm open for for options I would like I like more and more this idea of this flexible system with indeed Micro Surface and and maybe a knowledge graph or social graph and and this layer of calculation and output especially because we're having so many discussions that yeah the flexibility of such a platform would be extremely important so truly brought in because
yeah
because right now like with the POC the calculation is done within the same system so if we're to expand it like I originally we plan to you would have expanded that same database and just the calculation package but that wouldn't be enough to input everything else that we wanted so maybe just make sense to split every thing from now and then if we're having an idea while it repetition input or whatever then everything will just seamlessly feed into each other
okay
I'm talking like it's simple but in my head it makes sense
so I'm I even come can take this further than this
so in deep funding around 4 which is not too far away I don't think we'll have a completely new voting portal for instance with strength of conviction so we need to work towards that but I don't expect that will be happening deep funding around for yet
so maybe defending round four will even be a kind of intermediary thing and way we do it and way we vote so we can think about what what is minimum requirement in which case scenario if you guys would tell me listen guy listen young we have no order option we really need to go back to one token one vote in deep funding around four and you're able to explain that to the rest of the community I would even say okay yeah you start start fresh and and build from there all
so I'm not all too hung up on those things also to be very honest the
the reputation ratings did work they work better in defending around Street and deepening out for but they are far from perfect maybe also because we didn't the whole wallet linking thing wasn't ideal maybe when we have that better integrated in in words in wordperfect that that might also be be an improvement but we need to have a proper percentage of people having a reputation before that mitigation actually works properly I think there was one very clear case in last round deep funding around three that's it clear all the splitting and we almost rewarded him and it was on the third of fourth calculation because there were some issues in the calculation Etc that we finally saw not not perfectly but saw that when we had all the calculations right that this team was not rewarded anymore which
actually it was would also have been good if you would have been rewarded because then we could have made an example out of this season is what happened if we don't do whatever maybe identification
or something
but yeah
Kenrick
well
I I will have to think more carefully about everything you just said and take that income but my first thought is to
stick with the square root waiting of the wallets since we've made that commitment
and then
I'll have we'll have to talk with Dominic and Joanna in terms of what basic kind of reputation system can be in place for deep unfor whether that's even possible or not to provide some protection
but I actually do strongly recommend

not doing the ranking from one to 10 until it's implemented properly
you know from is that kind of been emphasizing in my mind that was just a kind of a bug in the implementation of quadratic voting
you know the priority should just be fixing the fog
and then we can go from there with a more robust system
so so how would you see voting happening then in the next round
if it's not one
well what I'd say is
what Carlos is doing right now might be an option which is you have an option of either just being supportive of the proposal or you abstain
there are difficulties that come in if you don't have constraints then down voting um becomes does create some problems
um so if you just have I think what they're using is yes and abstain and then I could we can check on the details of that but I do think unless there's really a security problem like there's just no we have nothing in place I strongly recommend that we still have the square root rating of the wallets I think that's kind of
yeah I mentioned as a recession scenario
and so for instance for this test rounds we don't have any measures I'm not measuring reputation or whatever we will just do it with red asking with no mitigation whatsoever and just to hope that it will be okay and not telling too many people about it to avoid any issues but you can do your take
advantage from that
opinions
so yeah I think we should we should also have that quadratic balance in there I think that makes sense but
we can also just take the risk of wallet splitting where would be good if we would have some may I think that's the most important thing if you would have some way to identify wallet splitting and and can make very obvious cases can can remove them and regarding the and we could do that maybe just by looking at transactions and where the the the age of the wallet I think that would already be a very good indicator and should technically shouldn't be too hard
that I would say from that good coin article I read that seemed to be part of their defense mechanism is they do analysis but then ultimately it's like a circle team that analyzes the analysis and makes a judgment as to whether there was malicious collusion or not yeah
that is tough yeah
but but if you kind of
the analysis as long as you're transparent about it with the community
then it seems to me that it it's reasonable to do a manual analysis whether there was any problems and a manual adjustment with some kind of decentralized decision about it and particularly for a test round
or with the understanding that this is just kind of
incremental steps towards a more automated system
yeah
so I I think that there is also that there's also an important observation in the last round we had manual assessments on rewards and I think having a manual assessments that is supported by algorithmic or or mathematical analysis also makes a lot of sense so that's what we did and Rojo did in the second instance they did do some algorithmic comparison of reviews that people gave and then had a way of having people give their opinion and I suppose it wasn't perfect yet but that's a very good road forward I would say so for all the splitting if we can have a 90% confidence based on algorithm that somebody is indeed in using unwanted and desire well that's splitting and then we can have a menu
review on that to to take out the sharp edges here and there that would be would be wonderful
regard great voting and one to ten
I think we should keep it in until we have a better system until we have that conviction strength that would be a good mom otherwise we're changing now and then changing it the next time I'd rather change it one time from this to a next methodology and what we could also do there could be worthwhile is look at the retails from defunding around three
and imagine that everything above a six or seven is a yes and everything below that is an abstain and then see what would result have been with those metrics and and see if we would like them or if it would have any impact at all

yeah maybe that can be a separate conversation and it'd be helpful to have either a mathematician or computer scientist or singularity in that as part of it
the reason I say because I don't you know
I don't want to be argumentative at the same time there are some things that
you know are more like mathematical proofs rather than a community poll about opinions and in this case
I think it really is just a flaw in the implementation of quadratic voting and so continuing with it is would not be my recommendation
but
it'd be good to have some you know as I said someone either with a mathematical or computer science framework as part of the conversation yeah
so we need good arguments so so what I wouldn't like from a user experience perspective so let alone functionality and how it actually works is that we have had three rounds with one to 10 then deep funding around four will just be yes or abstain and then running deep funding around five we're introducing something else yes and abstain but strength of conviction I think then we are making two Junction I'd rather make one jump and then explain once to the community how we are changing it and and what instead of having this middle step and until now I think the
degraded voting doesn't turn out that bad
so we honest it was also been at the very first who opted for that so if we want to move away in that I would like to give him some
yeah we
are not because Ben is sacred for me or whatever I'm happy to Go My Own Way in a lot of things but I would like to present them from arguments why we're doing away with it without having something else in place so you can convince me that
opt-in or abstain in favor of abstain will actually remove problems that we have or remove risks that we are having now and lead to better outcomes
I'm not against it I'm not married to anything
I'll do a second thing too is oh I have a conversation with Dominic and Joanna whether in our current work just implementing the quadratic scale on the conviction maybe isn't even too hard it's just a matter of implementing properly so that might not even be a hard thing to do we just do that for round four
I'm not quite it's not quite clear to me right here but
yeah maybe we should
options for it I guess yeah
let's think about how we want to how we want to do voting in deep funding route for what makes most sense whatever so I remember I think I even in round one I did some analysis like this what if I think I actually should have read it back that's something like that above 7
is yes and the rest
is no what would be the outcome I'll see if I can find of course it's just round one with not that many contributors Etc voters
but that's a that's a relatively easy exercise to do looking backwards and see what if if we change the data and that way
right
conver
sation I'm gonna have to go up I got another meeting to prepare for
okay thank you Kendrick
yeah
maybe
that's right
no yeah I was saying a great conversation and glad that we can do it so widely and and have that step back I think we actually did that and and didn't hold on tightly to our position so I think that's very important being open-minded so thank you thank you also Kendrick for your contributions and that social graphing it sticks to me and I really like that direction so let's see
all right
thank you thank you all 19 minutes go by quickly
so

I just wanted to say what last thing two things actually something that I need to think about more but I think we should really take advantage of like blockchain and how transparent it is I know we do all it splitting in terms of all it history and stuff but if we were to somehow crack the idea of minting I know it doesn't work on card I don't know but maybe we can talk with some experts a non-transferable token for every token that for every wallet that is voting within deep funding that's a way to just make sure you know whatever we have to think about that but that's not the point the other thing is so for just this MVP because we're taking a step back

is there any pushback in maybe just taking some more time to actually work together more requirements and design that the the solution before you know actually going ahead with building whatever was set out in the RFP

that's right can you explain it this second point in quite get it

just take to like maybe taking a little bit of a step back and having some more calls and Gathering some more requirements about what we want the architecture to be yeah and designing that first like just really focusing on design because if I don't want the POC thing to happen again where we're building and throwing it away so maybe

putting more efforts into the design of what we were over the system to be and then seeing exactly what we can Implement with the MVP from there

yeah

I'm

totally fine with that I think probably deep funding around 4 will be in

hopefully two months or less even so I'm not sure what we could accomplish but we do have defending around for so we have to make a decision on how we will treat it and I don't want you to rush into things and develop all kinds of stuff that is not really what we want just for because then we will there always be another reason to do something quickly

so I agree with you that we should have a proper design the proper architecture that we can rely on and build upon and blockchain layer ties into that I suppose

yeah okay so that sounds really good we can have an internal meeting to see if we need to alter anything with an actual proposal but I think yeah if we have just a big focus on design architecture design and then seeing how that would be implemented forward with our work and then with any rfps that we might want to put out for defending for how the voting thing will all work out together so if you guys are okay with that that this is I think well we'll start to do from now

yeah I'd rather have deep funding around four being a little bit off in terms of voting and and winning but then starting from Deep funding around five and six we are really building something solid that we believe in that we can build upon Etc then rushing into deep funding around for and in deep learning around nine we still have

backwards because

there is code that is not right or things that that not behave for black boxes or whatever

so maybe what we could do is set up some other types of workshops with some solution Architects that we might know and now I have a way better idea of what we want the system to be and I think Dom you as well so

we can start from there maybe raw or if you know anyone I'll know some people and then we can

you know start from there have the big design and then break it down that way I think that makes the most sense

yeah yeah I agree like this conversation was really helpful to yeah

kind of

crap the the big picture and see also that and also just

because I've seen the code from the POC it's yeah it doesn't make sense to

to Russia and then have the same situation again after defending run for that it's not really we can't really build what you actually want to build

say then don't do it don't use it I have a lot of respects for Robert and and what he created was useful maybe we can still useful use it as a standalone thing for one rounds just to get us through that but then in the meantime bills something that that is normal way of History yes hopefully unexpected

in hindsight like we did build exactly what we needed to build for that time that we build this POC even though we had like a good idea of what the future of it was it was very high level so we couldn't really future proof that proof of concept just yet from an architecture perspective so now that we have that I think it's a good starting point to to think of the bigger picture actually

and I guess there is some code that we can can reuse or like can with small adjustments can reuse today but yeah I think it makes sense to start with a white sheet of paper and think about designing architecture in a with all this stuff that we've now discussed and that we know

to start building something that can last last bit longer

so that's actually important maybe some people of the R&D gills can help us with some new microservices even without an RFP we will find a way to finance that if needed
to that wallet's history and and transaction thing for instance
correct
anything else or
just making fascinating topic and it remains that way and I suddenly see myself as this dots in between a lot of other dots and if I don't do anything else but other people do things that is somehow reflects my my reputation and I think that's on one hand very weird but on the other hand very cool no
and it's very it's actually proven like I know I keep referring to this paper but they did this stochastic model on like the reputation in a community and how they affect each other and they implemented the social Factor where like any person I bring in this is just one example but any person I bring in their behavior is automatically reflected on my reputation
yeah so
then they did a big study and then the end result was everyone now in the system is working at an equilibrium that's good
system like it's the most optimal way because everyone started it's like okay I'm not going to bring in someone that I know it's gonna negatively affect me and then they're not going to bring in someone so like it's just this like positive reciprocity mechanism kind of
Utopia here we come
all right
and I can imagine we will do that we'll find weaknesses but then we we can make some merge different systems like a very old-fashioned rating mechanism with the social graph give some weights and and get something else out of that so
wonderful wonderful
thank you guys
thanks
for organizing this guy's a great that you're using this grants as well and and really happy with this Felix you have been uncommonly quiet and we we haven't talked for a while actually you're becoming a bit of stranger lately but yeah Chapo for this
thank you
thank
you
guys next week
see you later
all right
bye
