DeepFunding Reputation Workshop #4

February 23, 2024
https://www.youtube.com/watch?v=FWqTuSkR_jg

In this workshop we will bring together community members from the DeepFunding ecosystem to explore what we can learn from each other and apply for a Reputation System at Deep Funding.

The Workshop is part of the funded proposal in DeepFunding Round 3 which executes a series of workshops to define a recommendation document on a DeepFunding Reputation system.

Meeting Hosts
Dominik Tilman & Felix Weber

Participants from the SingularityNET & DeepFunding Community
Vani
Guillermo
Wims
Duke
Celiwe

Meeting notes of discussion highlights and perspectives/opinions on specific topics:

Reputation System Design Principles

- Interoperability, so keeping in mind that reputation is highly dependent on its context.
- Different layers of reputation
- Context can be bound to environments or time
- Contributors decide on which data they want to subscribe to the reputation system
- The reputation system just verifies subscribed contributions
- Individual contributions can be tagged to specific groups
- Tasks on group tags generate group reputation
- Should not make value judgements (good or bad statements on contributions)
- Recognise wide range of skills
- Reputation changes quickly, check the Catalyst Proposal reviewer evolution from the most dominant group to a ghost with non impact over a short time, degradation of reputation

Governance and Community Building

- Should promote decentralisation
- To build a strong builders community, this will help to build decentralised beneficial AGI
- Reward people to work together
- Reputation system should support organic long term growth
- Should sustain long term contributors
- Must be always open to newcomers, constant focus on new member adaption
- Avoid hierarchy, there are a lot of risks in emerging hierarchies
- Can it be a flat structure vs should it be a flat structure
- Experimenting if it can be a flat structure (horizontal hierarchy)
- Should focus on individual experiences in their ecosystems
- Should promote equal opportunities
- Improve and support effective treasury spending decisions, ensuring high quality votes/decisions

Contributions and Motivation

- Bad reputation, bad actors should not be seen as banned forever for bad actions
- What if bad reputation follows a contributor and Decreasing reputation if contributions stop
- Tho system is always open to restart
- AI as copilot to support contributors in their actions, focus on improving contributor quality where it matters the most.
- Don't be afraid of failures, when we mess up things we see what needs to be done better
- Should respect efforts
- Reputation helps people staying motivated
- To have predictable outcomes from a user perspective, clear action lines, if i do this > that happens
- Rank or level system so people are motivated to climb up
- Incentivise valuable contributions at DeepFunding community operations (DeepFunding Circles)
- Intrinsic motivations can be built from reputation

Concerns and Challenges

- Qualifications (titles, diplomas etc) and their relation to reputation, should there be some basic requirements to engage
- Not a system where past matters most
- How can we build confidence in the validations of a contribution
    - not expecting too much from the reputation system, look on it from an objective perspective as simply data, let's not make too much value judgements
- What are the entry barriers for newcomers to a reputation system?
- To address important questions in the right environment

- Thinking about what it should not be! Too many not completed projects funded through proposals

Specific Examples and References

- Got funded for proposal and delivered
- Got funded for proposal and did not deliver
- Didn't get Funded but still delivered
- Polkadot has the fellowship program where it takes 17 years to achieve the highest rank
- Reputation system sets a social order, good example is a family
- Can help to develop “universal income”

Full Transcript

and this computer
and there we go today it's Friday the 23rd and February 2024 and today we host the last event of a series of workshops
from a funnel proposal from Tiffany around 3 which is all about the reputation focus group on which we spent four workshops figuring out analyzing ideating brainstorming on reputation systems for deep funding and they we have to host your feelings and Tom and very small round of participants
hey Ronnie hey Salif nice nice to see you happy Friday and thanks not for taking the time but sometimes even good to have smaller rounds because then we can go much specific on educated topics
quickly screen to give you an oversight on where we are right now and and it's what happens so fast
quickly yes therefore I use a kid book so what we do for each Workshop
we document the stuff which means we take notes and record the meetings and then we start to outline the whole thing so but first to the context a little bit of the whole thing like mentioned the proposal is a funded initiative from different angle 3 and we'll just quite important to the context to understand that within the singularity ecosystem there are a bunch of already existing efforts which are working on specific reputation systems for for example issue of Mineplex Sophia though Etc they all doing the part on this and we want it through this proposal provide the space where we print a bunch of people from within the Deep learning ecosystem then at the second part from The Singularity ecosystem and the third part
from the larger blockchain space together to look what we can learn and ideally
build some strong knowledge which helps us to ideate the Innovative and fair reputation system for deep funding The Proposal was in the ideation pool means this is a proposed with started with hey we have a nice idea but not yet a concrete plan and follow-up proposal we can definitely count on that Dominic with trust level where we'll do something in this Regard in the funny wrong father

on the Workshops the first Workshop so place on channel Library 26 where we had some people from mainly deep funding itself
but you can see for example we had to look at guilliam who's from the real Circle the unhaulings Joanna from portway Kendrick and Rocher so I said Ambassador review Circle and the funding in the crew
and the second one we then spoke about a general single Eric said quotation systems where we had mine click Singularity net Foundation review Singularity though Sophia yes what Rick and representative from community
that's well and the third one this took place last week on Friday we then had a call with Forex from Peter and Rafael example from The Singularity Foundation Nicholas Cerny governance Lee from Cabana phone patient Victor and Tom brokawada temples and once again show on from 43
and we spoke about a bunch of stuff
and I share the link to the to the get book as well and
checking
you can find the most of the documentation there and you can also
right use our GPT so we created our own CPT which is trained by the material or not this was the wrong way and so before this
3
Edit the link
it's on work group like the
if you go on the overview exactly and this one exactly sorry
there you go and you can chat with the thing and it's very well trained on all the workshops and can give quite some answers on insights and not
and for today for today we pray bunch of these topics to this call and look what is the most relevant in this regard for different community and yeah how should a reputation system look like which matches your ideas Visions needs
while this ideas be crazy about the
yeah I think that's it
yeah I am maybe a crazy idea but maybe we can
asks our GPT like what's what's this like different questions and then discuss them like see what TBT says like for example like what what's the challenges what
what
yeah some whatever requirements what are different concepts and
see what
AI says and then see if you think we can agree or maybe we need more perspectives on that
just continuously thinks it's got a good reputation or not yeah for example
I'm joking sorry
I'm pretty awesome actually to today's font I'm happy to go with whatever suggested
one thing I would love to mention is actually a little shitty because before we started to record we start already to have a really good discussion with funny on the reputation one thing which really stuck to my head and I would like to bring this back maybe a little bit more for a little attention whilst with the reputational context actually interest Rica
because what we saw already through the series of workshops

reputation systems are definitely important for each project each ecosystem bunch of projects within an estimate and a large blockchain space mostly really when it comes about recognizing contributions
building strong developer ecosystems or Builders ecosystems and making sure that the system captured into governance as well right so we go into more equal decision making process which reputation ideally enables and unlocks
and a lot of time in this regard like
it's a lot of community members where a lot of heads in this regard and they are usually engaged in multiple areas multiple projects at the same time
so when we look on the reputation we set already okay interoperability
of reputation should be quite important
but then it was mentioned that the industry was really something I really want to think about this phone with access the context of the reputation right
say in which regard we have to protect reputation as well
in this figure
to make sure that they're not transfer us maybe into some sort of
popularity or forcing social behaviors from individuals actually so that's not a system which you can actually impose a certain behaviors and people have to react to them then simply like in
not sure but this makes sense yeah it's sort of that idea that if you give a dog a bad name so
if people have a bad reputation in one context if that follows them then they just live up to it because they don't see any way to escape it so that I think is something that we know happens in real life in social situations but does it happen with online reputation and yeah I suppose it's just racing a question about do we really want reputation to follow people around I can see reasons why I can also see reasons why not
one thing I have thought about in the past is
start from scratch every so often I don't know once a year once a quarter
I mean people who've built up really strong good reputation would probably hate that
but it does give people the chance to start with clean slate Maybe
yeah another way could be that your past actions like the impact was actions on your reputations decreases over time which means what you did I don't know half a year ago as much less impact than what you did yesterday so it gives like there's a few things that would come with it first of all you can change basically and also
it gives
like if one set like a very good reputation and never did and after that it didn't contribute anymore but you still can live from I don't know what they did two years ago it's probably not fair for those who were very active since then so I think they're
yeah that could be a way to deal with that
so since we cut into context it's not only the environment it's also the time right
I think this makes sense of them have her own personal experience right now actually with this with the singularity and passwords program because as I don't let let's say a contribute a in the way we set it up with the contribution system and now with the new setup let's say I'm not anymore in the core contributors and I can contributors group however I was initiative of building up the whole thing right and I actually really like this it said oh cool yeah so arcade to catch up with the new system I have to restart from cro as well

and whatever added before this is actually reputation
it's not classified data it's not there it's simply you can say hey I was definitely beginning I know what the stuff is about right but it's not contextualized in this regard so it's like a free asset
but it's not accepted by the parameters that's in this regard of the reputation system which invites people into the contribution core contributors let's say in this workout for example
and being exclude just feel fat or
because of parameters make sense and in this regard
and I actually like it as well and as our own experience to know my reputation is not forever so the reputation system itself adapts and divorce over the time each time at the tops over the time it sets new parameters and previous engagements will not fit into a new parameters Maybe
and this is kind of
nice to know okay the stuff is dying off
by itself if you want to if you really want to start and well you know exactly how to do and drop them there you go right
but
I think we know you know even in real life communities I hate calling them that I actually because this is real life as well but you know I mean and if
people who were kind of founder or important members of something if their reputation like dies off over time we lose a lot by them no longer being part of the core I think
yeah so I think it is a double edged sword that one and the community benefits from all that knowledge
and if that knowledge is no longer seen as
part of the core contributors or whatever then we're losing something
I'm not very fully agree on the sex because I think when you say we lose something like we don't lose the person we lose the experience the knowledge knowledge and expertise which this person accumulated right and when somebody steps out I think we always have this challenge of how do we conserve the information the knowledge the experience which leaves us so that ideally is decoupled from the individual we have don't have to be worried about individuals leaving because we're able to what they should do everything possible to let's say
and extract that knowledge and yeah so I think this is not with a contributor itself not so much to the system if you
I don't know but I do think there's more to what a person brings than their knowledge and their expertise
I think they're sometimes there are things that you can't replicate
we're all you know you'll bring our own unique thing I don't know
maybe it's even good still we can't capture everything so it's there's so it's still
Goods that the human beings and as a very value the very human beings and our advantage over but and stuff that's avatars that are coming up
yeah what I wanted to add to
the contextual
reputation that I think we had that discussion and last Bookshop with Tom from work hard and that's
the the way they want to set it up that they change parameters and criteria over time not
and the main reason for that is

that if you if it's not dynamic
then it's easy to gain because you can adjust the parameters and then just play a game to get higher reputation it instead of
Behaving normal and
so that you can't
yeah that it puts it a bit
to say of the radar like that you think oh this act I have to do this in order to get that so that it's more
yeah if it's prominent all the time I think communities would lose their natural Dynamic which is not what we want to achieve with a rotation so yeah so you mean it's like making it less transactional so it's not like you do this you get this reputation and that's there's always that equation yeah I guess it at the end of it it's to be
you need to find the right balance and I think that's a it's a very tricky part so yeah
it's
something on
different counters Association I think where what you mentioned that's where I think they really like this as well to say it has to be a non-static system it has to always evolve always change right if not here
it's not tutorial what it was
well
and what I also really like or like I think it was we touched on that in the first Workshop there is a
paper I think it is was like a research paper I think it was published in years ago
and it
explored reputation
in a way that it's not connected just to your individual action but to your
peer group that you are interacting with and also like to the crew with the people that you bring in the system and in theory
that model seems to work quite well that you
not only impact your own reputation but that's your actions have
affects people around you and the other way around that how people behave
or people act or contribute kind of goes back to you I think that I can't come other challenges with that as well but it's at least in that paper it's
obsessed that the reputation output or this the level of whatever you get us an output is more seems to be more accurate and the incentive to
contribute
in a like or to bring value to the community is seems to be higher than if it's just affects your own reputation I think it's also very interesting observation
yeah I mean do you think that
potentially groups have reputations with you know towards each other
because I'm thinking that you know there are some groups that you think oh that's they've done some really good work I would want to get involved with them and others not so much and I'm just thinking like the idea of having a good reputation in a terrible Group by all vice versa
the interaction between your group's reputation and your reputation you know

you know I'm thinking like the situation of I don't know a flashiest leader in a really nasty right-wing group has got a great reputation within their group but outside of it they're an Athena really

yeah the question the question actions as well I really see this is when you say grooves and whatnot do you guys have a number in head where you think this is the max amount of let's say participants which could participate in a reputation system like it's a 10 or 100 or a thousand or a million oh tricky

I sort of feel like maybe there are layers and maybe there is a reputation system for a big big group and then maybe somehow it breaks down more into smaller so great I don't even know how that would work but I'm just thinking about how it happens in our social interactions you know it's like the more you know somebody the more complex there reputation is in the more nuanced it is

it's yeah I can't really answer that question I've

I think the more people you have at least a certain point the

more data can tell you because you can

yes a lot to compare but it also might I don't know get

whichever she hits a at some point but but yeah it's

and then a foundational requirement for reputation system is to have his a lot of historical data

that's because you need you need to have some context and some track record otherwise

yeah it's it's gonna be like

very difficult to to measure onto or take your context that but yeah

I would say hopefully

we can build systems for

the picky groups like yeah Millions I mean it's sort of true that you only need them for big groups where maybe there were people involved that you don't really know because you know anyone here or anyone that I know well if they had a terrible reputation score I just know that's weird but it might influence how I actually react if somebody I don't really know has got a bad school

yeah that's a good point if you know everyone in person you don't need to in yeah you don't need a system that scores them you just see it and you remember what they did

but yeah especially like in a virtual and decentralized environment

it's yeah

reputation can be a trust building like a shortcut to build trust only because all sort of

because they're the only real neat why we actually want to measure or cancer reputations we want to have it implemented in governments right so we need some kind of assets some kind of data

that's just what you said something like maybe most developer resourceful reputation are the things you don't even want to measure you just put it public you just put it out and say hey this engagements this are contributions we can verify contributions yet we do not qualify them we do not State them or into us or what not in this regard it's just data there for everybody

to do their own research actually and that's like and

about how wondering if a good reputation system should have some element where an individual who is assessing other people can

make some private ratings on

the other people's reputation let's say if I'm trying to work out whether I trust Felix and let's say he's got a terrible reputation and then I work with them and I think actually that's not deserved and he's good
so maybe I should be able to whether it's privately or whether that actually feeds into his reputation that I can say actually I don't agree with this writing
yeah that would bring an interesting layer into it like a public
available
score and to private one that's still kind of fits into the analytics yeah that can be verification yeah it could be an interesting
verification layer oh I like I like the like area oh that's a hope but when we say that the reputation system itself because we don't want to go into the scrap to say we build a surveillance system actually in the right so to say that okay what happens if the contributor because the main thing is the contribute has brought I provided data right whatever this I joined in the meeting I did a proposal I what not this stuff what happens on other platforms right on a bunch of different platforms actually in this figure
so and when you said and actually that the contribute has themself they produce data for the reputation though when it's up to them to say okay audio there are contribution systems there's a bunch of augment transparent stuff nothing from the is taking into account by the reputation system
because you are the owner of this you decide which of the data you will actually want to package and say hey I generate here data package which I want to have recognized from the reputation system
hey we got a proposal fund to implemented this here outcomes here that's action for example something really easy to verify and it's up to the people themselves to actually say which of my data do I want to give
to this reputation system and the reputation system in this we got is nothing else than a validate on this but it does not really qualify Justice yeah okay you are right so you come actually with a
like a request for reputational proposal for reputation and
since as owner you are always able to say Okay I want to take this off as well so you're in full ownership actually of the status it's already you who set them together it's you who subscribe them and it's you who can cancel them for it as well
yeah that's why we need blockchain right
yeah I
I just got a proposal funded in Catalyst to
use like that they have so much data and what I'm gonna do with a darling from I don't need nation that we
analyze
the reviews of proposals
with the outcomes of the proposals and to
and then to see if we can identify reviewers that
like if they rate something good and it gets funded it they deliver if they
rate something bad and it gets funded and it fails then like like people that actually
do objectively good work and maybe give them more and then see if it would give them more influence into the reviewing system if

the reviews itself
get more valuable and makes it actually easier for Waters to make good decisions so that's
and so it's like very objective that I actually like still you can they're probably proposes out there that deliver on paper but if you would really go into it it's actually not that impactful that I will be another layer but
and just to use the kind of objective data
to see if
yeah an easy if that could be already an easy way to improve the
yeah how to say that like the
value of the reviews itself or that the rating itself
and presumably also if somebody rated something poorly and it got funded and true exactly it didn't deliver right exactly exactly to
and it's quite quick to run this on Cutters because you have a really nice data set from since once this is actually something really cool right that you can really hands on and database and in this look at you don't have to build so much theories I think this is and this can be something really interesting then as well when you start especially because you're in Catalyst empty funding right when you look then okay which insights from there can be fit and to like oh this is cool stuff though I'm happy that's about this one funded yeah I just had a conversation with Chris and because they sitting on so much really rich data but they don't have really capacity to
to like to to really look into it in a way that okay what what value can we get out of that that it's maybe a bit more hidden but it's there it's like all this like patterns and
so yeah
it's gonna be a nice experiment
I think what might be missing there though is how do we determine whether a proposal has
been successful and achieved its aims I mean yeah if it completes that's something in his favor but I up so often see a proposal going oh we're gonna do this we're gonna do that we're gonna change the world we're gonna and what they actually deliver is not really what they said they were going to deliver so mmm
Yeah that's so we would actually need a
another layer
and
well the way you could enrich the existing data is that you take
a set of proposals and
like that it's never completely objective because
people
touch the same thing differently about if you have a kind of a circle that touches the the outcome
and
so you could lay a second
that would give a second layer to
to just the outcome itself like yeah I completed or I didn't complete so there would be just for testing purposes they would already give
yeah a better I hope so at least I suppose a better score at the end
but they're down a good reputation system is going to have many layers

it's
I don't think it's
possible to do it without that
you need a lot of context and then you need context for for context I kind of
it maybe we can try to identify some of the I really like the layers idea actions as we come to say each layer isn't different context actually each different context has a different set of parameters and and maybe this we can figure out already through also at the after today's Workshop to go through all the material and see already Archie that's it for actually in this workout like just identifying some layers in this workout already look that if the layers makes sense because
I'll send this ricotta also some purely technical layers right where you can say okay pretty much everybody holds 80x
for example in this record
and to make some very very simple parameters which don't imply any behavior let's say in this figure right but
that's one thing with you what you what you said before and what did I know to the door
because I not had it on
and fuck fuck about what it's sorry
pickups
by the the layer like the different layers with different parameters it's my
underlying assumption that like for trust level like what I intend to do and I got my underlying assumption you need that otherwise it won't work so
the like very basic models that we are building at the moment or like we experimenting on our yeah that's that's my underlying assumption that you need this different layers and then if you have like this different layers and you have like a big graph that a base and then you
should see patterns and then you should be able to see classes of people that bring value and maybe you can even predict by their actions what what's gonna happen so that's another would be another like
kind of use case of reputation as well
but yeah that's
how to say I
actually can play in in the reputation system they took governments
I mean like you said already right it can already predict behaviors in this workout for example but when we think about that okay ideally the contributor is the ones who develops and deploys it's data center from Twitter reputation system like you subscribe your stuff to the reputation system in this figure
cut AI be some sort of co-pilot in the space says a look there these are actions relevant to your interests whatnot to Simply guide or support navigation Center this way regard and actually making sure okay cool you have to
but not that much then maybe to to work on the reputation set
because when the also on the layers right if you put if you put AI on top of the thing and say okay hey I helps us to build the replication and just like that but when we assume no everything is based on the individual they I has to move it and actually within the network to make sure that the best data actually is provided in this figure

because also what the squids you don't need a lot of data right you need a strong quality of data actually in this figure so bring everything to the individual even though AI identified when I support the best then directly the individual not the system but by the individual by default to the system

I my another proposal in the funding like the one the RFP 2 another unique Knowledge Graph that I got with a trust level is exactly what we're trying to

do exactly that so we have

we do it with a news article

and we have different AI

analysis algorithms that

that analyze if they are biased subjective in nature that their sentiment polarity and stuff like that and it's only AI what's that

analyze and hopefully within the knowledge graph we can already see like for that specific topic that specific that's author or that that article that publisher has the highest trust level so that's the way we call it but yeah we actually try to see if that works

it really depends on the on the board so obviously so we we are at the moment like five Milestones to our delivered and the third and in the fourth are kind of

connected to each other and we are at the moment trying to

optimize the bots so that they deliver more accurate trust at trust level for each article and therefore for each author and

see if that brings

some some good insights into the data sets that we're using yeah

can can be another layer and and basically what I want to do with the Bots afterwards is I don't want to

call them like fake news or truth detector because that's difficult but if they're I want to have them good enough that they would sort of bullshit like everything that's kind of

not worth for an individual to to analyze or to validate so they just sorted out that would also make could make a reputation system more efficient

if there's more use for that maybe yes but that's kind of the

minimum

that I hope that I can let this what's actually can

can support the system

it's Celine and sleeve wins what are your thoughts on

on reputation

maybe totally in a topic for you but what laughter here but your thoughts are

you thank you for the opportunity yeah and really I think it's it's a needed to it's from one of it or what I'm hearing it's it is very good

we have a space for it it's platform that is necessary so thank you for coming up with

this idea I see going fast thank you

sincerely and fine once what do you think wins it's a cool name by the way they speak English

I just said in the church that is audio it's not working

okay no problem

don't feel stressed I think that thanks a lot for people

I try to set them and they like massively agree

and just collect that that you've got the most relevant stuff in place already we have to find the proposals thank you that's awesome
yeah it's such an experimental space at the moment and
I
I did a lot of interviews the last couple weeks with different like program managers of this interest Innovation funds like
and also like dollars or like other decentralized
decentralized news outlet and stuff like that just to
hear their their take on unreportation how it could improve their
their system so yeah it's yeah what I wanted to say it's like a very experimental at the moment so you have like lots of different initiatives and ideas
but yeah it seems like there's a big need especially with the
with no AI
creating so much content you need some and also like fake a lot of fake content or like creating signal right and narratives which is probably even more
problematic so you need some kind of
measurements to
be able for people to build or to have a track record and therefore build a reputation at least for their Community or for their
for that specific thing but yeah it seems like there's
the need or the Earth to
have something
a system or protocol in place seems to
seem to be very strong or getting getting stronger rims
if you have
a great things I think my mic now is alright you can hear me yeah very good
for some
it's a pleasure for us to be here
my name is Bennett iswanda from women in move Solutions
thank you familiar with me and normally use whims
well sorry for being late I think I missed a lot of information on concerning reputation building
if one part of funding is that you have in
okay from my side I'll just give you what I feel I really don't know the nitty critics of this how
you propose to use it
but I'm just looking at the catalyst system where
a
we have been there for quite some time
we've been working with the Catalyst not only the catalyst
with katana foundation with iot
then the pretty much they know us
and did they know our efforts that we have been doing
we have been trying since almost two years to build up a reputation online interest build up a real community in Johannesburg
they always there

our website I can share our website here
to see our effort I don't know Africa
that life
is the effort where we try to
Showcase some of the things that we are running
but when it comes to catalyst
you are applying for funds with everybody who is new to kadanu
whose reputation is unknown
and they are competing at Power
in the quite often
it leads to unpredictable results
for the very fact that that
winning competitor who came yesterday
we don't know
his or her reputation that companies reputation
that companies used to but somehow some of them have got a reputation outside cardano
and they have been very successful they've got built they've built communities
but then still when you come to the Catalyst funding from find one to fund
a 10 and now we finished fun living
about 45-48% of the projects have not been completed
so
why
that's a very big question will that could take a long time but I think part of it is there is no reputation barometer
attached it to this whole process
we are finding somebody you don't know
in the who has not even proved anything within the ecosystem of cardano
so
that could be one reason that could be the contributing fake one of the contributing factors
so there's another thing where
we have had some communities being run
the town halls being run
almost more than a year by sitting companies
and if let's say an entity company or a community runs a town hall
for more than a year using their own funds and resources
I think it's enough reputation
to assist that entity or community
to move forward even expand
this doesn't exist
so that is why when I I it's not my first time hearing about this reputation
it was introduced to me by water
and one of the water meetings
and then we enjoy one expecting we said okay they said one of the differences with Singularity net

to what is currently happening with catalyst
when cut down
it's sort of a there is a recognition for you
therefore through reputation system so I didn't know the initi critics about it
so maybe I don't want you to repeat what you have done before but that is what my understanding my take currently is concerning this
what I would personally like to do what I have done in Johannesburg
is a again give you an example of Telly language this lady
right this lady joint Williams in 2018
and she was brought into our community by the University of Eunice
because she was the first and only lady researching on blockchain
during that time
on and off on and of honor of up until now
I have got a high reputation for her
number one
she is always consistently enough available
so she means she has seen value
in the blockchain in katano
and she is putting effort
that is one thing attendance for a long time in an ecosystem is a sign that that person
I mean why is that person there that is number one number two
not only long time attendance contribution
for example this lady lives in another country but she tries she travels from another country to Johan speaking comes the
to run
a summit or an event like last year in the 2023 Summit
Community
she had to travel the whole time and coming there to do that and yet
we have got some even cardano very strong cardamon entities or names within Johannesburg something
they don't attend
don't value don't even have sisters built a community they want but when it comes to the catalyst
it's a game who gets funded who doesn't get funded
how wish this reputation could be some sort of you are gaining some reputation points when you do this activity successfully
then you get that the type of maybe let me compete to something like it it did on SSI
okay I've got this date
and then accumulatively then later on when there is funding
then you consider these ones with certain
quantitative Deeds that approvable
and attach it there maybe you get something small in the beginning they look at you how to use that small little fund that you got
then if you are efficient and effective

then it can increase because the whole aim of a grand or a fund
is the expansion of the ecosystem
it is not a gamble with fans that is how from my perspective
if I have missed anything
you can correct me if they were I miss something you can correct me
if you've got something more or really welcome questions or contribution that is what I can say
thank you
thank humans especially because you have a bunch of experience directly related to the topic right I think what's really interesting so far our conversation mostly focused on let's say the individual within the reputation system but keeping the whole side of approach and its reputation right or Community well let's say a larger crew so I think this is really interesting connection this regard as well like when we try to scale it up and step by step right and say okay in the core ideally until funding Singularity and we have the individual the country Buddha in the center each time they generally data they say what they want to subscribe that said to reputation system
and then the relation with each other let's say for example let's take for example somebody like African Town Hall if you say okay all let's say individuals who run the African Town Hall their subscribe the country witness okay we run the African tunnel here's a proof of it he has to record it and they are relate to each other maybe in this figure right it's not a reputation system relates to each other but maybe there contributions were relate to each other so the individuals recognizing themselves no as a team by simply engaging in the same topic
so maybe they're subscriptions can be very similar maybe that can be some sort of let's say data standard which can say after which group do you want to affiliate your contributions
and direct detect a group in which you help maybe like this that because when you do it like this as more the group confidence and over longer time it's more available data will be associated with a project right because they take it they they call it there so you would have a sort of emerging reputation for projects then as well which have to grow by the contributions from the individuals
if none of the individuals contributes anymore the project doesn't is intact with any current contributions anymore right so his reputation for slow devices
is precisely a really agree I think we have common experiences definitely
and I like it comes back again to
it needs different layers
so you need to capture completely different things
because
that's the only way you
get context and then reputation we can make sense but without context
through different layers
yeah that's
a reputation score might not say much
so yeah
thanks thanks for sharing that
especially also another point for this really interesting that if you have projects who propose sometimes you see this insane thing that

whilst mentioned before what happens if a project get funded and delivers
or if get funded and doesn't Deliver us but also what happens if a project doesn't get funded and still the levels like this is a fucking strong metric right because now you can say oh okay that's
pictures are totally out of the box right so this is a
something where you can say right this is pure commitment very strong data actually interested right
yeah it would be
yeah I think the challenging thing is to capture things that happen outside the system but
it would bring a lot of value into a system if that's somehow able or these days a way to translate that afterwards for example maybe maybe someone
does yeah doesn't get funded but
can prove oh they still did it
maybe maybe you can add that at some of this in a way into the system as well
even though it would also be yeah
you probably can game that quite easily as well but yeah
it is interesting interesting point here so
you can't gain it that easily because if you say okay let's say you're usually as a system you have this kind of reports and I think reports are cool after all it's something really important right it generates okay here the links this is what happened overall and to say like for example we do reports and deepfunning or cattle
when we use such just the same structure say okay you didn't cut from it still delivered
here the report form is open subscribe three of us check it anyway and if you did so so you can use already existing resources actually for this
they do the check go through the evidence of the of the stuff and you say hey we operated Africa town hall for one year without funds but very easy show The Proposal of the last time you got funded put a record to each YouTube link since then which happened online give a link to the Taylor Chrome where you can see oh yeah people are engaging that and that's it very simple actually
I just feel a little apprehensive about the idea of having it as an element of reputation that you deliver something that you weren't funded for I think it's amazing if people do it but it shouldn't be happening she don't mean people shouldn't have to do that and obviously not everyone's in a position to so I'd really hate it to be like you you gain more reputation and more clout for doing it than you do for not doing it
the other thing I was going to say is I'm just wondering Bernard what do you see as the elements of the reputation for an organization or for a project I mean I suppose I'm I'm thinking here about the fact that
a project can have an idea of what it's going to do and it can fail
and by failing it learns something and that learning is fed into the system and I think that's a win
so having it as like a completing new project and doing what you said you do maybe that's not the only thing that should be reputational
thanks for another let me
make sure that they get your question correctly

the question basically is what could be the elements of
what we can tame a reputation
yeah what should we look at yeah
yes
the first thing is
what is our aim
in our aim is a community
whatever type of community we have
it detects
what objectives we need to embark on to achieve that a
if you do not have a well-defined aim
which is not likely the case most of these communities similarity net cardano Dev go to well defined aims
and the objectives must align to the aims of what you are you want to achieve
so that is where on the objective side the elements of the reputation can come from
they cannot come outside
the objectives because if they do so
then they are not part and parcel
going to contribute anything to achieving the AIM
basically all communities have corporately one
aim growth
and growth what does it mean it means number one
adopting or getting new people
not only that is good
getting new people onboarding new expanding by numbers it's not only important
the second one is retaining those that you got
if you combine these two retention of those that you have got growing them with the skills that you have
and then secondly then expanding by getting new people coming in
you are going to have what they call the effective growth and long-term results
let's reflect on the Catalyst from fund one tool fund level so I'll refer to it because this is the only first blockchain a type of treasure grants I know of
a dash started this thing of the treasure but I don't know if the similar project like catalyst
this one is now a sort of a what we can look at and say what it should not be
if I ask you on the
fact right now
if you have about 45 projects since fund one
let's talk about three years or so
if not been completed
so fun one fun too you didn't learn anything
country
infantry white it into your reflect and say hey wait
before I go to fund for why are those projects not completed
what is the problem

and fix it before you you release one for but you go to fund 4 and interesting in one year they were about three fans within two months that we're running like this
and then eventually what we have right now is we sit if you've got about 40 to 45 projects not completed
in again there's a report that came out I think I started this three days ago
which was talking about dead coins 74% of data coins on cardano
what is that the simple all projects in 2020 till now
which failed
maybe it was started very well with the Twitter account
it is called and then eventually now when they visited
it's a it's an archived project
all those tokens that we they are dead
so now 74% of these projects on cardano ethereum bitcoin they sampled belong to cardano
so now again for me I think it's an issue of
somehow something along the objectives we are missing some objectives that are essentially achieving the AIM
and I I am of the opinion that it is
you are not recognizing certain individuals or
certain entities could be companies or communities
we have tried to put effort there but they have not been recognized
so the question is what are the elements of being recognized
number one I think reputation is one way
to recognize people who are existing
and then they
that is a very difficult question to say what are the real elements of that I can only say the elements are nothing but those activities
that promote the objectives and the objectives that help us achieve the aim of the community
anything else it is not aligned to the aims
it is not part of the objectives
will be persuade for 10 15 years we are not going to achieve anything
but if we pursue those activities repeatedly like right now okay we went into fund 10
in the infant and what was very interesting is
all right you have got almost 50% of 50 45 million or 45 million Aida
approximately I think 4 million went to the catalyst
50
percent it went to two companies basically
then to me it was okay then these two companies are katana
not in indicative sense but in the fact that okay you have got the whole world and we are saying a decentralized
but now you've got out of 45
million about 22 million is going to entities
those entities could be communities could be individuals
could be whatever but they had to

and if you take these two out you are left with the 90 majority of all the people who applied for the catalyst
but definitely this is not decentralization
so one element of reputation is it must promote decentralization in its true sense
we can look for more I can go read more find more send more debate on what this could be
but on the blockchain now
there is more awake that will require to do
on the blockchain why because we are dealing with Anonymous entities
all devotees Anonymous you cannot prove anything
it's anonymous
so I don't think a reputation will require anonymity
maybe you can say now if we go out of anonymity then in what sense are going to be decentralized
it then he have no answer to that
because people went to blockchain because it's decentralized in the anonymous
but now when you need to build a community will that be effective especially how do you attach a reputation to an entity you don't know
then it means at some point in time there must be compromise of kyc and anonymity
to bring out a truly transparent acceptable
a reputation
I don't know Vanessa if you
if I was just mumbly okay no it's really the only thing that it made me think when you were talking that I would question is
I mean I totally agree with you it's not just a numbers game it's not about you know getting people in it's about who you retain I thought that was a really strong point but I think
the point about that you know does it align with the aims
I mean for me I do a lot of projects that are kind of based around co-production so you go in with an idea you work with a community and you try to engage them on an equal basis and I think honestly the reputation of a project should be higher if it does change
because it's responding to the people that it's working with and it's like well you know if you go in with the idea that you're going to do such and such and the community you're trying to engage goes no we don't want to do that we want to do something else if you don't pivot you haven't listened to them I mean it's really I think this is really specific to those kind of community engagement projects and maybe it's less applicable to a development project but in a sense I think even Developers
they got a respond to the conditions that they find and they've got a respond to issues that crop up so I'm really in favor of projects that don't necessarily end up aligning to what they thought their original aims were
and I just think it's super interesting to think about what we mean by success
for me
the thing that is least close to success and should least have good reputation is a project that goes in January we're going to do this and then in December goes we did exactly what we said we do and we didn't change
I will call that effectiveness

remember you can be effective with a certain activity but that activity may not be in line with the community
let me give you just an example
in cardano is predominantly a technical community
and it's aim was to eliminate poverty Pinky and paint that is the AIM
but then who are the majority of the unbanked
who are the majority of the poor who must be a emancipated
from the financial problems
but what type of activities then to you need
to achieve these aims
then somebody comes along
he is not a technical person
he opens and runs a town hall
which is just a platform where now
anyone anytime every now weekly we know Africa townhold is running I can call the get information learn contribute like that
a would you
it disregard to this person
would I mean this this effort is in line with the growth
of the community
even if it is not on the developer side like I know that technically is a lot yes come on now I certainly wouldn't disregard that and I think I mean one of the things that I see in many web 3 communities is a focus on
developer skills and technical skills and there was somebody in the community I can't remember who it was he probably are actually used to say we're all developers it's just some of us a tech developers and some of the developing Community or education or whatever so quite like that but yeah no totally wouldn't disregard somebody who is building community and you know making sure that something like Africa Town Hall runs
but you know the other thing that occurred to me is when you said who does that
also apart from whatever skills people have who does that is people in Africa or in the African diaspora and I think there's something to be said in terms of success and reputation around lived experience and what you might call own voices people doing stuff for themselves and for their own communities rather than that top down approach where somebody from outside your community goes I know what you need
you know I didn't actually are we going off the point here where we're talking about what is a successful project
I mean I think we started off talking about reputation of projects and yeah maybe that there is something there
and I think we kind of said it earlier when we talking about your reputation within and outside of your community
but
yeah I wonder what would happen if our reputation systems were about our projects not about ourselves
do we separate the individuals who contributed to the success of the projects

and the projects I mean the reputation is it going to be
on the project or the team players or the team that
he made that project is success
I mean that could be something we can recognize and look at it deeply to say when we say reputation
it is the reputation of individuals
that could be one way plus the reputation of the team
to the reputation of the project
because also the projects on their own
as an entity developer projects marketing projects onboarding projects educational projects they can carry a reputation their wife for for repeat funding
or for replication on other different community members
yeah because what this is making me think then is the what you as an individual they will don't do has an impact on the reputation of the rest of your team
oh that's like that feels like
what what could decrease the say what we let's just really interesting how to preach one individual to a group of individuals because the group of the individuals reflects the project right I think from own experience what I definitely can say some projects they created the mission and vision years ago like for example that's all other and the Mission Vision doesn't change at all
it's still a very same right though the people changed a lot
they experienced a whole thing in this ecosystem and they still do exactly the same but fundamentally different maybe to through things nobody could have imagined in the beginning right I think what isn't this regard really interesting is to say okay then definitely reflect on the change of the individuals and that phosphoria the change of the project the project when it's sticks to its Mission set we do this but
and take stick to it right they just explore much more the diversity on R what does this actually mean now you have years of experience and your relation to this topic is totally different not the shit Lord more stuff you have thousand more questions than problems to to challenge right to say in this regard and once again when we bring everything to the to the
individual can say okay then that's kind of
reputation score let's say between 1 and 10 well what not and now you have a group so a bunch of the actions are tagged to a specific group
so you can exit now play around with the numbers a little bit and say What If I multiply or play around or setting a algorithm right to say okay a lot of people with a higher reputation shining together in the project
what does this mean that actually right
how does the project itself is a reflection of the individuals in this regard
and he never sets our own reputation squares much more just a matter set of the individual content let's say reputation scores coming together each time and approach
and what about a new person with kind of no reputation you know they're just arrived in the ecosystem and they somehow get involved in a very high reputation projects
do they also massively end up with a very strong reputation without really having done anything yet

just under okay the reputation system itself right it should be open for everything everybody oh who is doing what doesn't really it's not it's not a reputation system deciding it's more like
I think in this regard
is inclusivity the reputation system must include the minorities even new people and give them the comfortable space for them remember when they are in it's adoption
we have adopted in the expanded in good new people
so the system must really really make these people feel at home
for me let's say I get into your system
the first thing that I look into
how many old members did you retain
so if I get into any company that employs me to work
I always check first what is the turnover
what is the rate of turnover of this stuff
so this company is no
what you call it a
retention strategy
so it's only focused on achieving goals at the expense of how those goals are achieved to the means justify the end
I like that example of Kimber lips I have also been starting leaky fish
and a you're going through the
say a lot of frustrations why some some of their projects are just thrown out they are not voted for
so
I would say a reputation system must be inclusive new people must feel at home actually if new people even if the system is very hard but they realize that a
these are the targets the longer I stay I contribute Ico the system along these objectives to achieve this aim
then they will stay
then you are achieve the retention strategy
if all these elements they work together
how reputation
just like it's a chaotic system of okay we want to see this build is working okay it's great but then there is no Market
because there is a the reputation for promoters or there is not recognized and they feel like when we are here we are nothing
so that is why I think these things are interconnected
otherwise okay the other thing that is very important which I do agree
numbers don't mean
it's the best system it's the best community
we can have a community with million million followers around here but eventually that could be a short term
then within two three years or five years or so it vanishes
it doesn't even a live as a letters of a technology in the world
so long term is very important

the value given to the community that will last over a long term and members they change their way of life and adopt it for a long time and they can't do without it again I think what ever reputation system is in place that brings about long-term goals
it is good and those elements that make that reputation system do that they are very effective
no not sure if I agree with the term best community actually always if I hear best I have a trick and say wait that has never a best of thousands of Best But if you get what you say
the but really good points I take a lot of knots just a really good stuff like that's hey Google Yama nice that you're made it to
yeah actually we are already 24 minutes over we plant the box of for an hour
actually really love the conversation just really good stuff floating around I have no problem still going on for a while how's for you don't
we can continue for a bit I I did planned to
lift the office in a bit but it's a very I'm actually actually enjoying that we Felix and I don't talk much at least for this for the last half an hour and just listen to
to others because we have talked already so much about it and it's I love to hear
different perspectives and different inputs because it just gets
it's yeah that's one of the reasons why you wanted to do an open workshop with no Escape agenda just to hear different people's
take take and reputation and stay experience in the expectations or various so we can continue forward
okay nice that let's take a little bit about that
and Korea as you joined as well and you know nice to see you too but what are your takes what is growing in your mind when you think about reputation systems
Hi Felix hi Dominic
hi rooms and Vani starting you limo nice to have you guys
so personally so I'll be really personal about this I believe in the concept of reputation
and that's pretty much because I'm a little old school
all right and it just it just motivational theory it helps
it keeps the motivation going right it helps people understand order
and
my background I went to I went to I went to military school so in military school you'd realize that the more
reputation you gave to something or reward you give or when people realize that there was an opportunity for growth in a particular area in a particular field or Endeavor it gave them that internal motivation because as human beings we have this ability to
we can be yourself motivated but I mean an organization like this we we cannot leave people to randomly you know generates motivation because I mean you may have someone today and then you know have the person tomorrow we want to be able to create a system where we are living can have predictable outcomes right so when we know that or if you do XYZ tasks or if you carry out x y z function right you would rise in the ladder there's there's something to
reach out for for carrying out this outside of the monetary benefits you know where we're very competitive right so I like to play along the lines of our strength you know you need abilities and yeah but then I understand that in a decentralized community like Singularity net that maybe a problem

right that may be a problem because we're trying to build on the principles of transparency and decentralization we trying to knock out the hierarchical structure and excessive bureaucracy and all of that so I'm quite open-minded you know I'm quite interested in the conversation I'm quite open-minded to seeing how we can fuse we can create the fusion where we can have a reputation system possibly you know that also is decentralized you know it's it's an experiment so I like to approach life from that experimental angle so I'm open to it but predominantly or personally I would draft out drift rather towards the repetition system you know knowing that when you're coming here you carry out this tax you could move up to level one level two

like that and I mean that's just that structure around operations and all that you know I hope I haven't gone of course because I literally just join and so I'm just making um making

my conclusion as to what we are talking about and of course when you try to help me out yeah

now you're totally on point and this was really good stuff thanks a lot too especially interesting to hear that you come from the perspective from military backgrounds right so this really interesting as well to see ah okay it's from one side highly centralized highly top-down into environment from us exactly the opposite right so this is really interesting at some points to mention that that definitely applying here as well right but he meant to say it has people to stay motivated and yeah really as well to lead to some predictable outcomes but what would the user perspective like to say yeah okay I know if I do this that will happen right so very clear let's say points and your products and like something that I have to fellowship program where you have this ranks as well and take it takes 17 years yeah to gain to gain the last rank like yeah it's interesting but yeah but what I felt

yeah sorry guys for being late to I just saw the

meeting and so first thanks for the workshop I really enjoyed the discussion Duke those were great insights

I agree with Felix it's a

having the discussion or a perspective from the military side and ranks and all that is very on point

still a hierarchies run

all the way through our communities different circles or societies we have that at home with father mother you know

so we need that that kind of thing it sets an order you know and that's something that it comes natural to all us

darwinians you know living things in moving or crawling through the planet you know you have that in in all different societies from

all the whole chain animal chain so

and that comes with our responsibilities and being accountable you know going to hunt being a small you know Mama on a jungle or here in north of Argentina you need to learn the tricks you know being a cat at home you need to know how to sleep on the things so that's something that comes organically and comes with actions our responsibilities we have talked about this several treasury meetings that it's a place where all things come together because it's where we try to convert this actions into

um rewards no and we need to validate that we transparency

and this it always comes and I just joined with Vani was mentioned

the same thing you know how we value today and reward people that really bring or add value to the community
we impressions
oh you know being part of this discussion is one thing being online is one other thing then adding value bring in Solutions and all that that
I have to say in one year have been an exponential growth you know always but you have guys have done with the work groups and guilts
from scratch to today there's a lot going on now I'm sitting and trying to figure out how to finish on time with my outcome that is summaries for the R&D Guild and following Venice you know and the archive you know we are working on others
achievements and that is good because we're showing collaboration and that's part also of
of this reward and contribution it is reward for us
to be able to lean on somebody else's work without having that that by itself is a reward you know so we are adding value and we're working on on top of others achievement having that said
and you know when I come from I've been out of my country for several years
and when I came back and this is something that it's really linked with AI and what it's
fact how it's affecting us
so maybe we can link it with a discussion I don't know what I'm going to go to this but universally income no so and and it probably have something to do with reward and contribution because
they think of adding value you see how Universal income without adding something or getting people involved in achieving something and this what Duke was mentioned and you know what encourage you to engage what gives you motivated you know
rejected something
in exchange of for nothing or even worse you know for a misconduction so I think we the work we're doing in trying to have this contribution rewards the discussion we have before to taking this to a token without value you know something that it's it's
the gimbal apps experiment that now the minute experiment we have with a Time token what you guys are doing with the academy did you find in okay those are all valuable things then if we can transcend that into something that we can use and turn it into value also that that's useful because we are contributing with a holding tokens and the distribution and that's affecting the price and it's affecting our profits you guys have seen what is happening with our community in terms of token value and a lot of us are contributing to that by creating this is engagement well we're the other so if there's a thin line on this person
because we we create engagement and we create all this wallets but at the same time that strategy
needs of something to to
build something concrete and that's one of the things with the funding is looking for and
I I strongly believe that this is the right path you know to reward people for contributing and I'm totally important
joining late with Bonnie because we discussed this lately
I enjoy having people from all around the world contributing something
bring an ideas and innovating with technology

and really building stuff you know so
if we create a system that reward people that are value and bring stuff to the table I'm 100% on that then of course there's different values to what people can do for their knowledge so educating having an education Guild being so important
on this topic too it'll also valuable you know so I think we're in the right direction you guys are doing an amazing job on doing this and so we will
build and Perfection the system and make it a volatile and make it better and better and better and for that we need to commit mistakes and failures to achieve that so
anything that take us and take us in that direction
of experimenting and failure it's going to bring good results here
money yeah offense
yeah we might not have time to really talk about this I'm just raising it as something that occurred to me from what gay animal what you were saying I mean it's true that we do grow up with higher keys and a lot of the time but we don't all agree with them and I think we all feel that high hierarchies can limit people and maybe also they kind of put us into a mindset that we don't really like so I'm thinking how do we have a reputation system that doesn't enforce Ohio
how do we how do we create a flat structure for a reputation system you know maybe even something as simple as you know on off you've got a reputation it might be good it might be bad but you've got one or you haven't
and how do we create a reputation system without value judgment
yeah so it's not good reputational bad reputation and I think some of what you were saying before Felix about how people can select which elements of their reputation data they make public or you know add to create their reputation system but I'm sort of wondering what would happen if it wasn't about a value judgment at all and I guess yeah kind of
how we have an equivalency of different skills we've talked already about how sometimes in these web 3 systems Tech developer skills are valued above others and perhaps they shouldn't be and Guillermo you would just saying how people bring all kinds of different skills to the table how do we build into a reputation system the idea that different skills are equivalent rather than hierarchical and one's better than the other
again and it was enough time so say anything about that but I'm just throwing it in
so bunch of good questions right and how I see it solve for afraid of emerging as far from all the workshopsis ideally the reputation system it's non-static it's always changing and IT addresses questions
in this regard and I think it's the thing what always
evolved through stress tests right with the behavior we actually say not this is not how we want to see so I think by default we have to fail on a bunch of stuff though we have to ask the right questions because I think the reputation system itself is a really good practice to say where do we address this questions okay in this environment where it's about reputation and governments
and sometimes it's not so important to write different right answers right but to ask the right questions
and the right questions you can ask them years later they exact same question the question is still very valid the answer might change fundamentally already to us right to its context and experience
The Thinker

I preferred to only sorry oh no sorry I didn't mean to meet
I mean I suppose in response to what you've just said well I'm saying what I'm thinking is like is that something that people think of reputation should be should it be a flat structure and should it not be
hesitate to use the word judgmental but you know should it not be about value judgments or do we want to say no this person has a good reputation and that person has a bad reputation to be one it's completely like that
I mean I think there's a real range of what people think there and it might depend on what you've been dealing with lately whether you think oh God I wish I'd known that that person was this all that but
I don't know it feels to me like there's a lot of dangers in hierarchical approaches and a lot of dangers in good bad value judgments so I'm just wondering what people think is it's something we want that flat structure
you have chance somebody
okay so I I just wanted to add an angle to work bunnies seeing
so for me if I was going to approach the question I wouldn't approach you from the angle of should it be a flat structure I would have approached it first from can it be a flat structure
right and then when we can determine if it can be then we can now determine if it should be relative to the values of Singularity let's you know and our Visionary Direction you know in the next couple of years so I think the first argument should be can it be a blood structure right and in experimenting whether it can be flat structure and what came to mind when when you mentioned this was because I like to argue for and and also argue against it helps me stay objective you know if it's going to be if possibility of it being a plus structure then he has to be built not around qualification so to say maybe build around Infuse built around television I don't know just
thinking because oftentimes
because I'm addressed the only way a new person who comes in would not feel out of place right and if a new person who comes in with more qualifications and is expected to be under the leadership allow me to use the word other leadership of someone who is not as exposed not a skilled not as proficients as he is you know knowing acknowledging that the reason why this person's here is not on the Merit of skill but Merit of imputes that have been made over time could use the barrier and could use the resentment that possibly felt by the new person who's just joining it and increase motivation knowing that if I also serve my time maybe from XYZ level or you can
reports you know to X to move from X Y or from A to B you know it would also reduce the sentiments and biases around
and that also creates you for
overtaking about call it that meaning that you could be at level 5 for example but if you're not consistently delivering value and you're not consistent creating outputs that are beneficial to the ecosystem someone who just joined in for this consistently that could rise and rise and rise rise and gets past you and there's yellow fires here because it wasn't days of qualification wasn't based on your skin here and you know I adopted values of ecosystem and giving our best giving up and the repetition now have the output of the increase down already I don't know
makes a lot of sense

very good point
in the furnace has points on a flat system which
eliminates
judgmentalism gatekeeping eliminate
the morality like go to bed in terms of values
I think it's it's a those are very good points
so somehow to me this all these contributions are making me now see the picture
what we are looking for is something that maybe we can draw
two axis
one side is what do we want to achieve hierarchies
a tradition
on another side what you want to achieve intrinsic satisfaction for each individual which joins the system
then the more you have this the more it becomes fled
but then the more also the system suffers
because now if you've got a lot of people to contribute where you disregard their history achievements
they are qualifications
then again
can you really predict the future
on the other end if we move up on this one way or we look at the Traditions things that have succeeded in the past
and then the list the individual satisfaction because the individual now it has to reach level 10
in order for that person to gain that reputation so what I'm seeing is something that lies in between
so we look at this in between where
the Traditions everything
are not paid attention but at the same time they are not disregarded
the individual satisfaction
which is a flat system where everyone it competes equally they achieve depending on what they can do
somewhere in between I think the answer lies in between
what I see we are polarized some are coming here from the believing the military strategy of pages which if you look at it it works because if you look at the military personnel in terms of financial remain relation it's pathetic because they are putting on their life
but these guys are so motivated they go into war
into trenches they don't go back but you look at Financial is it really worth going for it it's not worthy for it but they are really intrinsically motivated for that
but it is a hierarchical system
We Go Again onto a flat system
where everyone who comes today or will come tomorrow is equal opportunity
a compared to somebody who has spent maybe two three years and is the one architecture of the current system that is brought a lot of achievements to all of us here
again then we we ask the question is

this flat system how
can we rely on it in the future if we disregard the past
we Are Holy human beings homemak means we always a better we look forward
believe in unknown future or we are always taking the future
based on what has happened in the past
so we have got these two extreme people some say no no
the past has been oppressing us a lot which is very true Sunny are right hundred percent structure some people did not have
an opportunity
by birth of where they were born at
to be academically or to be taking calligold
it's not their wanting but they like this technology
so it comes back to say
to it disregard again this ones who are effective because they achieved a lot of skills that make us move forward
so all of you have got very very very very good point but sometimes some of these points are on Extreme let's say polarity
that is what I I see maybe the answer from what I see now let's marry the two
the past
and the achievement try to test it achievements
I am a person who has been also an educator for a long time
one thing that I can criticize
this one I'm saying it very okay one thing I can criticize in the Catalyst
today a community reviewer
here's what is entrant there is no history looked at which makes us fall onto Vanessa's Theory
to be a community reviewer there is no one who even checks whether you're finished the elemental School
or even Primary School no one
you just go there and put in your review your feeling but okay there is no categorizing of the proposals to say if you were not having a technical background don't go for this a proposals they are just randomly given to people so you I can't tell you
you will find some proposal lending in the hands of people who have not even completed Elemental school but they want to get that rewards for proposal reviews
and they are written something they can't even understand
so now and then after that you Aggregate and you say okay this is a review Code 4 5 but it could happen that 50% of those Community reviewers
we're not let's say having the basic needs to really understand this project
here I'm bringing in exactly where I'm saying
it is a certain point we need to go back and say
when you need to do this to assess this there are prerequisites
you can't just draw anyone because we want a flat system equal opportunity to everyone into that one it's gonna lead into extreme surprising results
I can ask you Vanessa with the flat system where
equality whether you're new or old

imagine in an army we recruit anyone without looking at the history background and we give them equal opportunity to advance to different line what will happen
I can feel already that you are having fear
we can't take that risk
why because this is a specialized area so it's the same without the centralized environment
on the community review level on the Catalyst do we all just hand out these things proposal to anyone you join to the anyone I I can take 1,000 people from the street until them go and review those things there just the way you feel about it just sign up put your email didn't review you are going to get a 25 at a time state
there's a lot of money for you
rather than selling tomatoes in the street
and for sure there is no entry a barriers there is no look into a no but this type of and you will find even these people were in the street selling Tomatoes they will be sitting on community review
accessing
a proposal written by a doctor from different definitions
it is someone is 30 years and years of searching
and doing the experiment objective experiments and there really is good something and then it is in the hands of a reviewer
who has got no reason I mean
no background and is related
this one is two out of five
I can't get what this person is talking about I give him one or two five
so I don't know if vanessa is the point
is it really possible to have a complete non-judgmental no historic fled system which doesn't this which disregards
some values that try to intest it in the past
I will tell you there's a lot in the Catalyst it tries to flatten everything
so to avoid that some of the results of the catalysts are
shocking to me they were even shocking
looking at the article Proposal review reward for fun tonight
there's something shocking it's short to me it might not show you don't worry but how it showed me is
we have a bunch of about 3,000 sorry to say a bunch a group of about 3,000 reviewers or Community proposal Assessor
us all week two weeks differently it's okay we've got some of the 1080 proposals consumpty 10 okay we see that
but there was no average amount for each person I don't know how they arrived it is the result came like this
is One reviewer
the highest in
that person got a completed that amount into South African rand to 1 million Rand in two weeks
and I checked did this guy to 1 million proposals no

the person or the group did around 130 proposal then I said okay what about all the one who did 120 he did that person also get something close to 1 million something like 47,000 years US dollars
45-47 no to my shock the person who did something like a hundred and twenty that that person fell down to something like 5,000 US dollar
then I would say okay what type of quality did this hundred and 133 award dispensive over 45,000 US dollars
I couldn't even make sense out of it why because my background is a the old education system where we know for this type of assessment you need in academically qualified you give it to them for this one you need somebody with Elementary qualified for that so that is how my contribution is
thank you very much if you have got any questions
some of our declared to answer the but I don't want to be the only speaker
thank you so much
I mean I just say that take your point so you know I do but I'm not sure that the community assessor system is a good example of a use case for reputation system because at this point it's basically an onboarding process
the reviews are pretty much hidden in the voting app and nobody really takes them that seriously I don't think we've got no idea whether anyone reads them it's basically a way of bringing people into the ecosystem and making them a bit familiar Apple I mean I certainly in the past it had a huge amount of power and if you didn't get a good and
CA review as it was then you weren't going to get funded but it ain't like that now I don't think
this is actually such a thing I love the bit to think about because when I remember back in the early days like the cs&p say so lots of catalysts right there actually most dominant group of all everyone like they control literally everything and no literally nothing anymore right
and that's interesting as well like the when we spoke before about a reputation of a group right like in early Catalyst I was very high let's say rely that the whole system apply it a lot with it to the reviews actually in this forget I had it quite strong let's say croup reputation with him and catalystline and today it's like very much almost zero actually right
I said well
so this is a really good experience actually we can see how a group reputation changed drastically from fully dominant into totally ghost into the actually really short time frame
I suppose also it raises you know what is that reputation about something maybe they
what are they called now Community reviewers maybe they still have a good reputation or a strong reputation as something that helps onboard people and helps bring them into the ecosystem to learn where it's all about I don't know
it just occurred to me though when Bernard when you were talking it kind of came to me like is there space in a reputation system for somebody's own self-assessment of their own skills and abilities Because unless you have actual dids in place
in the early stages of you know you're talking about situation where we want to know whether a community reviewer
knows what they're talking about
eventually I guess reputation would build up and you get an idea whether somebody did but at first you just go in on what they say of themselves I mean we do have that thing now where you

kind of took a box at the start to say yes I think I can assess this category this category this guy but no one checks no either there's no way of knowing whether you took a box to say I can assess education projects we don't know if you really can it's just yourself assessment
and maybe that's valid and I'm just wondering if there is scope within a reputation system in general for it to include what you think of yourself
or is that just solipsistic and mad
the great contribution Vanessa
for me
I can only say let's draw a line to say whatever reputation let's call it a decentralized reputation system we come up with
it must be ignored
may make sense to a person in the street somehow
if it doesn't make sense to a person in the street
then definitely even if it makes each person in that intrinsically happy
it doesn't make sense
it doesn't make sense to give a proposal to somebody
who is not even gone through High School
to review or even cast an opinion about a technical processor doesn't make sense to be honest on the section I'm not sure if I create because for me personally I don't want to touch anybody say okay you went to University you went to college to you you went to school like looking for a lot of shit as long when you're confusions are right
who the fuck gives a good let's say should care about where you are coming from I think maybe from this web perspective also to say in this regard to be fair and say where you come from doesn't matter where you go to this is where we want to come in and say okay you come from a really poor or perfect background
doesn't matter everybody has the same options to go to right and to reputation system ideally supporting this
this weekend
I think I have the I think I have an understanding of what's going to try and see I think the whole High School University thing is just an example and and this is how I'm going to explain it
right in capital respond 11 I was part of that this one level and I will also
so essential projects to review and quite honestly I went through some projects that I knew actually nothing about
you know I read through the projects and I knew nothing about it but I was expected to give a review now I do not know the impact of my review
right on on that project on its only viability right I don't know what what degree my review may help for the get funded or not now on my end as an individual I have to put the pressure on myself to try to research to understand so he meant I had to learn about too many things within the shop here just you know he righteous review on that but most people or many people may not you know
oh you just write anything you know and you don't know to what degree that service a demerits to you know someone's work right I think I'm just trying to give to address what I think when she's trying to say the whole analysis with with high school University Professor it's just context it's not it's not an exactly indication I don't think so you make our privacy that's that's not

is it was an analogy maybe a given it but that is a reality
there is a nine out of 10 chances that is happening in the Catalyst
so what I want to ask I really fully agree with a venison Felix
to say let us not have a reputation where
the past meters most
but my question then now
will we have confidence in such a reputation system
in terms of how then do we ought it it's validity
or its future usefulness I don't know if my question is very clear
customers how can we build trust to the validation of contributions right
or confidence
and then how do we have trust or confidence in a reputation system
which
every let's say today we have got a new members
in the all are given the same opportunity to say we don't care where you come from
what religion what past whatever which is very good
but all what we want you we want you to apply for funds
but then when we get into that application for funds
then it means maybe how then do we build this reputation from step one to step two because the moment we reach step four then we already have built up a history
we have built up a past category which in future definitely is gonna use that
for certain decisions so in a way you might find ourselves in a contradictory environment where
we want to disregard this
a problem
in bringing equality
but then later on we learned into a situation whereby
we don't even trust what we have
when things go wrong I always say to people sometimes it doesn't matter how good does what I say what matters most is who will take the responsibility when things go wrong
that is what I say so okay
let's experiment
you believe in whatever extreme of this system I believe this or not this one with this one okay fine
experiment but
what will matter most is when things go wrong out of such a thing who will take responsibility
and money you have hands up
it's just
what we slowly close the core and yeah one hour over time so really good especially I'll make this my sort of final thoughts then and I sort of want to reply to Bernard's question how do we build trust in a reputation system I think maybe we do it by not expecting the reputation system to do too much
we don't expect us to tell us this person is better than that person and to create a hierarchy for us it's just data

and a reputation system would maybe just say this person has done this and has done that and we lead the evaluation of that to the individual who looks at that data maybe it needs to be a way of aggregating or simplifying it or something but
and questioning whether a reputation should system should make those value judgments for us maybe it's more a case of making the data available so that you know if I think somebody who has
worked in education is is a good thing then I go yeah that person has a high reputation in my eyes and if somebody else thinks well I don't give a monkeys about somebody who's not a developer then that gives that person a low reputation and I'm not saying this any such people of course
even though we know there are
but yeah that's kind of where I'm at
it's really good
and what what luck to invite and everybody anyway for for share your last thought
let's make a last round
but what our final thoughts which stick to you after the call at the end of the workshop no and then then we call every day
what do you think
money started already
but who wants to go first
according out if you don't go for it tell you
well Dominic because this might already but the
well that's it over to somebody else well first of all I think that's the workshop where I made the most notes
like really really good thoughts and questions and
for my completely different angle then the workshop before so we were like more
very much focused on like how to solve for reputation for that use case and now we took a step back and maybe even had like a philosophical
you on that and asking some ethical questions and
yeah and I think that
like for me personally that was like really really helpful to
take these things in the consideration as well especially because I am one of those people who try to build such a system so it's like really important to
to understand
yeah I would say the ethical or philosophical philosophical part of such a system and how it impacts yeah
persons at the end so yeah
very happy with that round I'm gonna pass it up to Duke
okay so I'd say that I'm quite open to the
experimental experimentation of this
right like I said in my first argument there are pros and cons
and then I think Dominic said something in the charts he was like the advantage is that it's open to everybody and the disadvantages that is also to everybody

you know I'm quite open to the idea of experimentation I like to I have a scientific approach to life so
quite open to the experimentation of it so either ways I'm good
once you have to pass through somebody else joke oh okay so I'd pass it to Julia
okay thank you do yeah so just to keep it short I think that
as I mentioned before when I
participate in the discussion everything we try
on this direction is is valid as Tommy what's imaginated and Felix failure is it needs to be our first order you know we shouldn't fear that all the experiments that have been
already going on are all all substantial outputs you know they give us data on that we build we if we don't fear that you know
we already out of the cape know we which has Fine fire we have all this thing that other result of collaboration and partnership through societies we are just one for example of that I I do read from the discussion windsworth mentioning all the point that Duke and Venice
that it's
well it brings to the members that contribute and add value a when they feel they are
have inconsideration and been rewarded they are motivated and they motivate others
and to be respectful with the efforts it's
something that this system needs to focus on because that brings you know it's like running around on the train and training and then the guys say okay you're playing on Sunday that's that you know that comes with a smile that brings you to get more involved and to work more towards the community so you know how you say how you say that
this is a system that can
show
that you know the show and put the people that really really effort them to pick something to help something in reward and we don't we don't miss on that we just want to he's gonna work because it will engage other people and they say okay I got this I did this and it's all about it's all about effort no and
well so
then you know you will incorporate the data knowledge through experience all the people that
doesn't have the skills they will get killed you know they will kill them up you know and they'll learn how to with all this toolsa and would help with others and people helping others should be rewarded people so it and that way we'll get as flat and the sarcodile our case but still you need teachers still so we are working towards finding that balance so every year for you guys do on that we will end up here now
awesome this one then went what are Yola last 12 on the car
it it triggered it let me say the triggered me into something that I enjoyed it very well very well
all your contributions your points have trigger let me say
me from my dogmatics number
so now I need to go back and read more
if you have got links or a certain book published
I'm really send it to me I don't mind if you put me on a one day full day
where we go through
this

into this because
it has triggered a lot of thoughts into his very interesting awesome maybe it's because we are few maybe when we women we're not going to have this deep thinking
we have got assumptions
that is where we are because of our different assumptions
one assumptions is don't judge anybody
then when you say don't judge anybody assumption is okay everyone has got the ability to think equal or with the same equal capacity
the opposite is a no people although they are rational they are not of equal thinking capacity
so they are sitting a lot of assumptions that are behind all these
we want to balance up individual satisfaction
which for example I'm if you bring in judgmental things then categorizing of activities certain individuals who will never fall into those categories
will not be happy
so it loses again that is reputation score of individual intrinsic motivation so for me I really enjoyed saying thank you very much
and I enjoyed it very much
and
be willing to even come up on board again
if they are some reading references
I will be very willing actually before I came here when I signed up I did request for some reading links
on this
there is any article published or Theory or something
it is welcome
I just invite me again
and I put to a link in the live chat there we have already a documentation which is started where you can see already some oversights and inside from the previous workshops it's the good book
and there you find also all the YouTube things we recorded all the workshops
this was the fourth of this one and I put another check link here as well this is a from all the stuff from the meetings we train our own GPT and you have a GPT which knows about
again much more about all the meetings and you can directly chat with the thing to live deeper and get more insights and stuff that's in the live chat and I had channel for this and no that isn't here the channel I think the best place could actually be to use the S9 Discord well on this record
yeah I would say Mata most
I know Matt the most sex not a lot of people if you feel comfortable friends of time there
so somebody are just some of the most but they are not really public so
and for content and continuation here and with this Workshop we closed the last of the four workshops so in the next days we will improve the whole documentation of the thing and then we write a summary and a recommendation for the community and Singularity and Foundation outlining a little bit what did we got together
what are the insights views perspectives from all sites on reputation in this regard and how short what things should defining reputation system definitely take into account

and from there I think a lot of you voted may also for our proposing defunding round three which funded this stuff and then for process you should definitely stay tuned and Dominic will lead us forward ideally with trust level and in the next defunding round for then have a continuation where they say Okay ideation no closed ideation and defending around 3 now we can go for much more concrete proposal I have developing a reputation system for differently indefining around for and everything what has done through this workshops quite a little bit the Baseline answers okay in which direction does the whole thing actually goes to so ideally that the whole thing is really better actually by what communities says should be there

but also in the workshops you will see we spoke with quite some people from Deep funding from why diet Singularity had ecosystem and also with other blockchain ecosystems so what main goal was as well to

actually a little bit all the different layers and to see how is reputation relevant to each of these places so yep that's it

thanks for that you wanted fast in the last front please vote for the content and stay water and stay tuned on the whole thing and there's more to come but that's true and thanks a lot this was really good insightful everybody

yeah thank you meeting thanks Dominic and Felix for running it

thank you guys for joining and contributing yeah very enrouting yet discussion

thank you
